3 hints for near-criticality of our Universe

- 1) Metastability

- Living on critical boundary of two phases coexisting

3 hints for **near-criticality** of our Universe

- 2) **Higgs mass**

- Tuned close to boundary between ordered and disordered phase

3 hints for **near-criticality** of our Universe

- 3) **Cosmological constant**

- Tuned close to boundary between implosion and explosion

Self-Organised Criticality?

- Many systems in nature **self-tuned** to live near criticality

- Need a **mechanism** for self-organisation of **fundamental parameters**

e.g. Self-Organized Criticality in eternal inflation landscape: J. Khoury et al 1907.07693, 1912.06706, 2003.12594

- Cosmological quantum phase transitions localise fluctuating scalar fields during inflation at critical points: **self-organised localisation (SOL)**

Phase Transitions (PT)

- **Classical** PT: varying background temperature
- **Quantum** PT: varying background field

$$V = \frac{\lambda}{4} (\psi^2 - \rho^2)^2 + \kappa \phi \psi$$

Outline

- Motivation
 - Criticality
 - Quantum phase transitions (QPT)
- **Fokker-Planck Volume (FPV) equation**
 - FPV dynamics
- FPV + QPT = SOL
 - Discontinuity
 - Flux conservation
- SOL solutions
 - Metastability
 - Higgs mass
 - Cosmological constant
- Conclusion
 - Measure problem

Fokker-Planck Volume (FPV) equation

- Langevin equation: classical slow-roll + Hubble quantum fluctuations

$$\phi(t + \Delta t) = \phi(t) - \frac{V'}{3H} \Delta t + \eta_{\Delta t}(t)$$

- Volume-averaged Langevin trajectories: **FPV for volume distribution**

$$\frac{\partial}{\partial \phi} \left[\frac{\hbar}{8\pi^2} \frac{\partial(H^3 P)}{\partial \phi} + \frac{V' P}{3H} \right] + 3HP = \frac{\partial P}{\partial t}$$

$$H(\phi) = \sqrt{\frac{V(\phi)}{3M_p^2}}$$

Fokker-Planck Volume (FPV) equation

- Langevin equation: classical slow-roll + Hubble quantum fluctuations

$$\phi(t + \Delta t) = \phi(t) - \frac{V'}{3H} \Delta t + \eta_{\Delta t}(t)$$

- Volume-averaged Langevin trajectories: **FPV for volume distribution**

$$\frac{\partial}{\partial \phi} \left[\frac{\hbar}{8\pi^2} \frac{\partial(H^{2+\xi} P)}{\partial \phi} + \frac{V' P}{3H^{2-\xi}} \right] + 3H^\xi P = H_0^{\xi-1} \frac{\partial P}{\partial t_\xi} \quad H(\phi) = \sqrt{\frac{V(\phi)}{3M_p^2}}$$

- **Ambiguity** in choosing time “gauge” $dt_\xi/dt = (H/H_0)^{1-\xi}$

FPV dynamics

- ϕ is *not* the inflaton: **apeiron** field scanning parameters

- Restrict to **EFT** field range f $\varphi \equiv \frac{\phi}{f}$ $V = 3H_0^2 M_p^2 + g_\epsilon^2 f^4 \omega(\varphi)$, $\omega(\varphi) = \sum_{n=1}^{\infty} \frac{c_n}{n!} \varphi^n$

- Assume sub-dominant energy density

- Expand around constant inflationary background H_0 $H(\varphi) \simeq H_0 \left(1 + \frac{\epsilon^2 f^4 \omega(\varphi)}{6M_p^2 H_0^2} \right)$

- FPV becomes

$$\frac{\alpha}{2} \frac{\partial^2 P}{\partial \varphi^2} + \frac{\partial(\omega' P)}{\partial \varphi} + \beta \omega P = \frac{\partial P}{\partial T}$$

$$\alpha \equiv \frac{3\hbar H_0^4}{4\pi^2 \epsilon^2 f^4}, \quad \beta \equiv \frac{3\xi f^2}{2M_p^2}, \quad T \equiv \frac{t}{t_R}, \quad t_R \equiv \frac{3H_0}{g_\epsilon^2 f^2} = \frac{\alpha\beta S_{ds}}{3\xi H_0}, \quad S_{ds} = \frac{8\pi^2 M_p^2}{\hbar H^2}$$

FPV dynamics

- ϕ is *not* the inflaton: **apeiron** field scanning parameters

- Restrict to **EFT** field range f $\varphi \equiv \frac{\phi}{f}$ $V = 3H_0^2 M_p^2 + g_\epsilon^2 f^4 \omega(\varphi)$, $\omega(\varphi) = \sum_{n=1}^{\infty} \frac{c_n}{n!} \varphi^n$

- Assume sub-dominant energy density

- Expand around constant inflationary background H_0 $H(\varphi) \simeq H_0 \left(1 + \frac{\epsilon^2 f^4 \omega(\varphi)}{6M_p^2 H_0^2} \right)$

- FPV becomes

$$\frac{\alpha}{2} \frac{\partial^2 P}{\partial \varphi^2} + \frac{\partial(\omega' P)}{\partial \varphi} + \beta \omega P = \frac{\partial P}{\partial T}$$

$$\alpha \equiv \frac{3\hbar H_0^4}{4\pi^2 \epsilon^2 f^4}, \quad \beta \equiv \frac{3\xi f^2}{2M_p^2}, \quad T \equiv \frac{t}{t_R}, \quad t_R \equiv \frac{3H_0}{g_\epsilon^2 f^2} = \frac{\alpha\beta S_{ds}}{3\xi H_0} \quad S_{ds} = \frac{8\pi^2 M_p^2}{\hbar H^2}$$

Quantum

Volume term

Classical drift
term

FPV dynamics

- ϕ is *not* the inflaton: **apeiron** field scanning parameters

- Restrict to **EFT** field range f $\varphi \equiv \frac{\phi}{f}$ $V = 3H_0^2 M_P^2 + g_\epsilon^2 f^4 \omega(\varphi)$, $\omega(\varphi) = \sum_{n=1}^{\infty} \frac{c_n}{n!} \varphi^n$

- Assume sub-dominant energy density

- Expand around constant inflationary background H_0 $H(\varphi) \simeq H_0 \left(1 + \frac{\epsilon^2 f^4 \omega(\varphi)}{6M_p^2 H_0^2} \right)$

- FPV becomes

$$\frac{\alpha}{2} \frac{\partial^2 P}{\partial \varphi^2} + \frac{\partial(\omega' P)}{\partial \varphi} + \beta \omega P = \frac{\partial P}{\partial T}$$

$$\alpha \equiv \frac{3\hbar H_0^4}{4\pi^2 \epsilon^2 f^4}, \quad \beta \equiv \frac{3\xi f^2}{2M_p^2}, \quad T \equiv \frac{t}{t_R}, \quad t_R \equiv \frac{3H_0}{g_\epsilon^2 f^2} = \frac{\alpha\beta S_{ds}}{3\xi H_0} \quad S_{ds} = \frac{8\pi^2 M_p^2}{\hbar H^2}$$

- Maximum number of e-folds for non-eternal inflation: $N_{\text{e-folds}} < S_{ds} = \frac{8\pi^2 M_p^2}{\hbar H^2}$

FPV dynamics

- **Stationary** FPV distributions $P(\varphi, T) = \sum_{\lambda} e^{\lambda T} p(\varphi, \lambda)$

$$\frac{\alpha}{2} p'' + \omega' p' + (\omega'' + \beta\omega - \lambda) p = 0$$

$$\alpha \equiv \frac{3\hbar H_0^4}{4\pi^2 \epsilon^2 f^4} \quad , \quad \beta \equiv \frac{3\xi f^2}{2M_p^2} \quad , \quad T \equiv \frac{t}{t_R} \quad , \quad t_R \equiv \frac{3H_0}{g_\epsilon^2 f^2} = \frac{\alpha\beta S_{ds}}{3\xi H_0} \quad S_{ds} = \frac{8\pi^2 M_p^2}{\hbar H^2}$$

- Largest eigenvalue $\lambda = \lambda_{\max}$ inflates most
- Determines **peak location** of asymptotically stationary solution
- Note: **boundary conditions** necessary input for solution

FPV dynamics

$$\alpha \equiv \frac{3\hbar H_0^4}{4\pi^2 \epsilon^2 f^4}, \quad \beta \equiv \frac{3\xi f^2}{2M_p^2}$$

- C regime: $\alpha\beta \ll 1$. Peak is located as far down the potential as allowed by boundary condition.
- QV regime: $\alpha\beta \gg 1$, $\alpha^2\beta \ll 1$. Peak is a distance $1/(\alpha\beta)$ from the top with width $\sigma \simeq 1/\sqrt{\beta}$.
- Q^2V regime: $\alpha^2\beta \gg 1$. Peak as close to the top as possible, with a distance comparable to the width $\sigma \simeq (\alpha/\beta)^{1/3}$.

FPV dynamics

$$\alpha \equiv \frac{3\hbar H_0^4}{4\pi^2 \epsilon^2 f^4} \quad , \quad \beta \equiv \frac{3\xi f^2}{2M_p^2}$$

$$S_{ds} = \frac{8\pi^2 M_p^2}{\hbar H^2}$$

Outline

 - Discontinuity
 - Flux conservation
- SOL solutions
 - Metastability
 - Higgs mass
 - Cosmological constant
- Conclusion
 - Measure problem

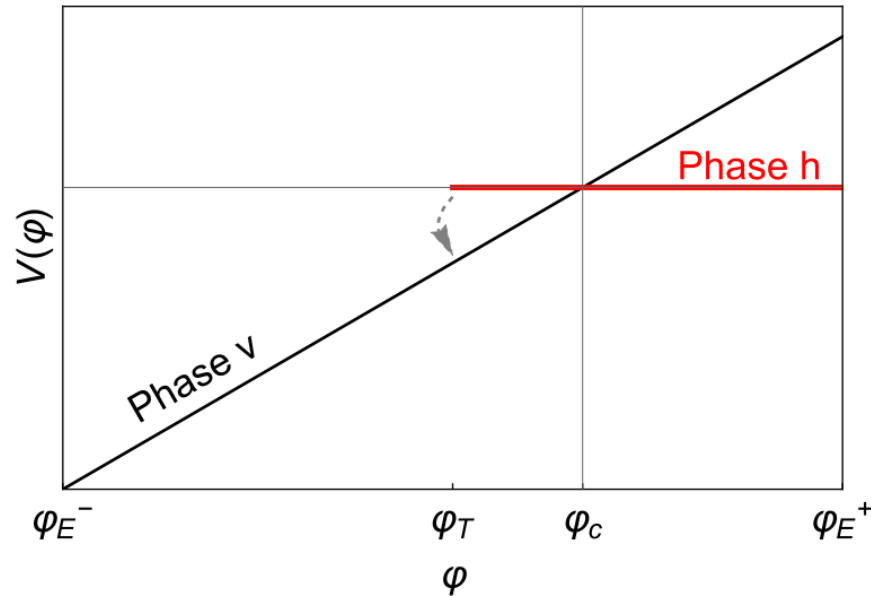

Junction conditions at phase transitions

- ϕ triggers 1st order quantum phase transition at ϕ_c
- Discontinuity in V' leads to discontinuous P'
- Requiring continuity of FPV across the critical point gives a junction condition to satisfy

$$\lim_{\epsilon \rightarrow 0} \int_{\phi_c - \epsilon}^{\phi_c + \epsilon} d\phi \frac{\partial}{\partial \phi} \left[\frac{V'P}{3H} + \frac{\hbar}{8\pi^2} \frac{\partial}{\partial \phi} (H^3 P) \right] = 0 \quad \longrightarrow \quad \frac{\Delta P'}{P(\phi_c)} = -\frac{2\Delta\omega'}{\alpha}$$

Junction conditions at phase transitions

- Coexistence of branches of different phases, require continuity of P_V and $P_V + P_h$ in FPV at ϕ_T : flux conservation junction conditions

$$P_h(\phi_T) = 0 \quad \Delta P'_v = -P'_v(\phi_T) \quad \Delta P_v = 0$$

Outline

- Motivation
 - Criticality
 - Quantum phase transitions (QPT)
- Fokker-Planck Volume (FPV) equation
 - FPV dynamics
- FPV + QPT = SOL
 - Discontinuity
 - Flux conservation
- **SOL solutions**
 - Metastability
 - Higgs mass
 - Cosmological constant
- Conclusion
 - Measure problem

Higgs metastability

$$V(\varphi, h) = \frac{M^4}{g_*^2} \omega(\varphi) + \frac{\lambda(\varphi, h)}{4} (h^2 - v^2)^2$$

$$\lambda(\varphi, M/g_*) = -g_*^2 \varphi$$

Higgs mass naturalness

$$V(\varphi, h) = \frac{M^4}{g_*^2} \omega(\varphi) - \frac{\varphi M^2 h^2}{2} + \frac{\lambda(h) h^4}{4}$$

$$\frac{V(\varphi, \langle h \rangle)}{M^4} = \begin{cases} \kappa_{\text{EW}}\varphi + \kappa_2\varphi^2 + \dots & \text{for } \varphi < 0 & (\text{unbroken EW: } \langle h \rangle = 0) \\ \kappa_{\text{EW}}\varphi + \kappa_{\text{IR}}\varphi^2 + \dots & \text{for } 0 < \varphi < \varphi_+ & (\text{IR phase: } \langle h \rangle = v) \\ -\kappa_0 + \kappa_{\text{UV}}\varphi + \kappa_2\varphi^2 + \dots & \text{for any } \varphi & (\text{UV phase: } \langle h \rangle = c_{\text{UV}}M) \end{cases}$$

$$\kappa_{\text{EW}} = \frac{\omega'(0)}{g_*^2}, \quad \kappa_2 = \frac{\omega''(0)}{2g_*^2}, \quad \kappa_{\text{IR}} = \kappa_2 - \Delta\kappa, \quad \kappa_0 = \frac{-\lambda_{\text{UV}}c_{\text{UV}}^4}{4}, \quad \kappa_{\text{UV}} = \kappa_{\text{EW}} - \frac{c_{\text{UV}}^2}{2}$$

- Unbroken to broken transition not sufficient
- Use broken IR to broken UV phase transition

$$\varphi_+ = \frac{-\beta_I e^{-\frac{3}{2}} \Lambda_I^2}{M^2} \quad \longrightarrow \quad v = e^{-\frac{3}{4}} \Lambda_I$$

- Lower instability scale to $\sim \text{TeV}$ through VL fermions
- Naturalness motivation: scalars and vectors heavy

Cosmological constant

- Hidden phase: vanishing cosmological constant by R-symmetry
- Visible phase: SOL localises at vacuum degeneracy point

$$p_h(\phi) = \sin \left[\sqrt{\frac{6(1 - \lambda_H)}{\hbar}} \frac{2\pi(\phi - \phi_T)}{H_I} \right]$$

$$\lambda_H = 1 - \frac{\hbar H_I^2}{24(f - \phi_T)^2}$$

$$V_v(\bar{\phi}) = V_I \lambda_H^{2/\xi}, \quad \sigma = \sqrt{\frac{2}{3\xi}} M_P$$

➔ $V_v(\bar{\phi}) = V_I \left(1 - \frac{\hbar H_I^2}{12\xi f^2} \right)$

- Solution must be in **C regime** with appropriate **boundary conditions**

Outline

- Motivation
 - Criticality
 - Quantum phase transitions (QPT)
- Fokker-Planck Volume (FPV) equation
 - FPV dynamics
- FPV + QPT = SOL
 - Discontinuity
 - Flux conservation
- SOL solutions

 - Higgs mass
 - Cosmological constant
- **Conclusion**
 - Measure problem

Conclusion

- Quantum fluctuations of scalar fields during inflation can be localised at the critical points of quantum phase transitions: SOL
- SOL suggests our Universe lives at the critical boundary of coexistence of phases
- Measure problem is a major caveat $\beta \equiv \frac{3 \xi f^2}{2 M_p^2}$
- Open problem -- motivates further study in context of SOL
