Problems for
EFT

Scenarios

Thermal
Fluctuations

Matrix Theory
Cosmology

Conclusions

- **Inflationary Scenario** is the **current paradigm** of **early Universe cosmology**.
- Inflation is usually analyzed using an **effective field theory** (EFT) framework.
- **Fundamental conceptual problems** for an EFT description of a rapidly expanding universe.
- **Unitarity problem, Inconsistency with the 2nd law of thermodynamics.**
- We need to look beyond an EFT description of the early universe!
- **Matrix Theory Cosmology**: Construction of an early universe scenario based on the **BFSS** matrix model.

Trans-Planckian Problem

J. Martin and R.B., *Phys. Rev. D*63, 123501 (2002)

String
Cosmology

R. Branden-
berger

Problems for
EFT

Scenarios

Thermal
Fluctuations

Matrix Theory
Cosmology

Conclusions

- **Success of inflation:** At early times scales are inside the Hubble radius \rightarrow causal generation mechanism is possible.
- **Problem:** If time period of inflation is more than $70H^{-1}$, then $\lambda_p(t) < l_{pl}$ at the beginning of inflation.
- \rightarrow breakdown of effective field theory; new physics **MUST** be taken into account when computing observables from inflation.

Trans-Planckian Censorship Conjecture (TCC)

SMALL-SCALE FLUCTUATIONS OF RELIC RADIATION

9

1970 p

Fig. 1a. Diagram of gravitational instability in the 'big-bang' model. The region of instability is located to the right of the line $M_J(t)$; the region of stability to the left. The two additional lines of the graph demonstrate the temporal evolution of density perturbations of matter: growth until the moment when the considered mass is smaller than the Jeans mass and oscillations thereafter. It is apparent that at the moment of recombination perturbations corresponding to different masses correspond to different phases.

Key Realization

Cosmology

Conclusions

1970arXiv:1701.02802v1

Fig. 1a. Diagram of gravitational instability in the "big-bang" model. The region of instability is located to the right of the line $M_J(t)$; the region of stability to the left. The two additional lines of the graph demonstrate the temporal evolution of density perturbations of matter: growth until the moment when the considered mass is smaller than the Jeans mass and oscillations thereafter. It is apparent that at the moment of recombination perturbations corresponding to different masses correspond to different phases.

Fig. 1b. The dependence of the square of the amplitude of density perturbations of matter on scale. The fine line designates the usually assumed dependence $(\delta\rho/\rho)^2 \sim M^{-3}$. It is apparent that fluctuations of relic radiation should depend on scale in a similar manner.

Problems for
EFT

Scenarios

Thermal
Fluctuations

Matrix Theory
Cosmology

Conclusions

- Given a **scale-invariant power spectrum of adiabatic fluctuations** on "super-horizon" scales before t_{eq} , i.e. standing waves.
- → "correct" power spectrum of galaxies.
- → **acoustic oscillations in CMB angular power spectrum.**
- → **baryon acoustic oscillations in matter power spectrum.**

Hubble Radius vs. Horizon

String
Cosmology

R. Branden-
berger

Problems for
EFT

Scenarios

Thermal
Fluctuations

Matrix Theory
Cosmology

Conclusions

- **Horizon**: Forward light cone of a point on the initial Cauchy surface.
- Horizon: region of causal contact.
- **Hubble radius**: $l_H(t) = H^{-1}(t)$ inverse expansion rate.
- Hubble radius: local concept, relevant for dynamics of cosmological fluctuations.
- In Standard Big Bang Cosmology: Hubble radius = horizon.
- In any theory which can provide a mechanism for the origin of structure: Hubble radius \neq horizon.

Criteria for a Successful Early Universe Scenario

String
Cosmology

R. Branden-
berger

Problems for
EFT

Scenarios

Thermal
Fluctuations

Matrix Theory
Cosmology

Conclusions

- **Horizon** \gg **Hubble radius** in order for the scenario to solve the “horizon problem” of Standard Big Bang Cosmology.
- Scales of cosmological interest today **originate inside the Hubble radius at early times** in order for a causal generation mechanism of fluctuations to be possible.
- Mechanism for producing a **scale-invariant spectrum of curvature fluctuations** on super-Hubble scales.

Obtaining Inflation

String
Cosmology

R. Branden-
berger

Problems for
EFT

Scenarios

Thermal
Fluctuations

Matrix Theory
Cosmology

Conclusions

- Assumption: Space-time described by General Relativity.
- \rightarrow require matter with $\rho < -\frac{1}{3}\rho$.
- Consider **scalar field** φ as matter: potential energy term has an equation of state $\rho = -\rho$.
- But one needs to ensure that potential energy dominates over other forms of energy!
- Require a **slowly rolling** scalar field:

$$\frac{V'}{V} \ll \frac{1}{m_{pl}}.$$

- Require rolling over large distances

$$\Delta\varphi > m_{pl}.$$

Matrix Theory
Cosmology

Conclusions

Challenges for Ekpyrotic Cosmology:

- How do we get the bounce?
- How do we obtain a scale-invariant spectrum of curvature fluctuations?
- Can we obtain a spectrum of gravitational waves relevant to current observations?

Adding an S-Brane to the EFT action can solve all three problems, and leads to two consistency relations for cosmological observables.

Action

Idea: At the string scale a new tower of string states becomes comparable in mass to the usual low energy degrees of freedom;
→ they must be included in the low energy effective action.

Included as an **S-Brane**.

$$S = \int d^4x \sqrt{-g} [R + \frac{1}{2} \partial_\mu \varphi \partial^\mu \varphi - V(\varphi)] \\ - \int d^4x \kappa \delta(\tau - \tau_B) \sqrt{\gamma},$$

$$\kappa \equiv N \eta_S^3,$$

Note: The S-brane has $\rho = 0$ and $p < 0$ → can mediate the transition between contraction and expansion.

Obtaining an Emergent Cosmology: String Gas Cosmology

R.B. and C. Vafa, *Nucl. Phys. B*316:391 (1989)

String
Cosmology

R. Branden-
berger

Problems for
EFT

Scenarios

Thermal
Fluctuations

Matrix Theory
Cosmology

Conclusions

Idea: make use of the **new symmetries** and **new degrees of freedom** which string theory provides to construct a new theory of the very early universe.

Assumption: Matter is a gas of fundamental strings

Assumption: Space is compact, e.g. a torus.

Key points:

- **New degrees of freedom:** string oscillatory modes
- Leads to a **maximal temperature** for a gas of strings, the Hagedorn temperature
- **New degrees of freedom:** string winding modes
- Leads to a **new symmetry:** physics at large R is equivalent to physics at small R

Starting point: BFSS matrix model at high temperatures.

- BFSS model is a quantum mechanical model of 10 $N \times N$ Hermitean matrices.
- Note: no space!
- Note: no singularities!
- Note: BFSS matrix model is a proposed non-perturbative definition of M-theory: 10 dimensional superstring theory emerges in the $N \rightarrow \infty$ limit.

Conclusions

Consider action of the Type IIB string theory in Schild gauge

$$S_{\text{Schild}} = \int d^2\sigma \alpha \left[\sqrt{g} \left(\frac{1}{4} \{X^\mu, X^\nu\} - \frac{i}{2} \bar{\psi} \Gamma^\mu \{X^\mu, \psi\} \right) + \beta \sqrt{g} \right].$$

$$\text{Partition function : } Z = \int \mathcal{D}\sqrt{g} \mathcal{D}X \mathcal{D}\psi e^{-S_{\text{Schild}}}.$$

$$\text{Correspondence : } \{, \} \rightarrow -i[,]$$

$$\int d^2\sigma \sqrt{g} \rightarrow \text{Tr}$$

Obtain grand canonical partition function of IKKT model.
