

An effective theory of medium induced radiation

XQCD 2022, Trondheim Norway

28.07.2022

Johannes Hamre Isaksen
PhD student in Theoretical Physics
University of Bergen

In collaboration with Adam Takacs and
Konrad Tywoniuk
Based on [2206.02811](#)

Jet quenching

- Colliding two heavy nuclei creates quark-gluon plasma
- Hard collision makes highly virtual particle
 - Radiates and creates jet
- Medium interacts with jet and modifies it
 - This is called jet quenching

Illustration by C. Andres

Jet quenching

- Colliding two heavy nuclei creates quark-gluon plasma
- Hard collision makes highly virtual particle
 - Radiates and creates jet
- Medium interacts with jet and modifies it
 - This is called jet quenching

Partons going through the medium

- Transverse momentum broadening
- Elastic collisions with medium constituents
- Radiation
 - Vacuum-like
 - Medium induced

Illustration by C. Andres

Jet quenching

- Colliding two heavy nuclei creates quark-gluon plasma

 - Radiates and creates jet
- Medium interacts with jet and modifies it
 - This is called jet quenching

Partons going through the medium

- Transverse momentum broadening
- Elastic collisions with medium constituents
- Radiation
 - Vacuum-like
 - Medium induced → This is what this talk is about

Illustration by C. Andres

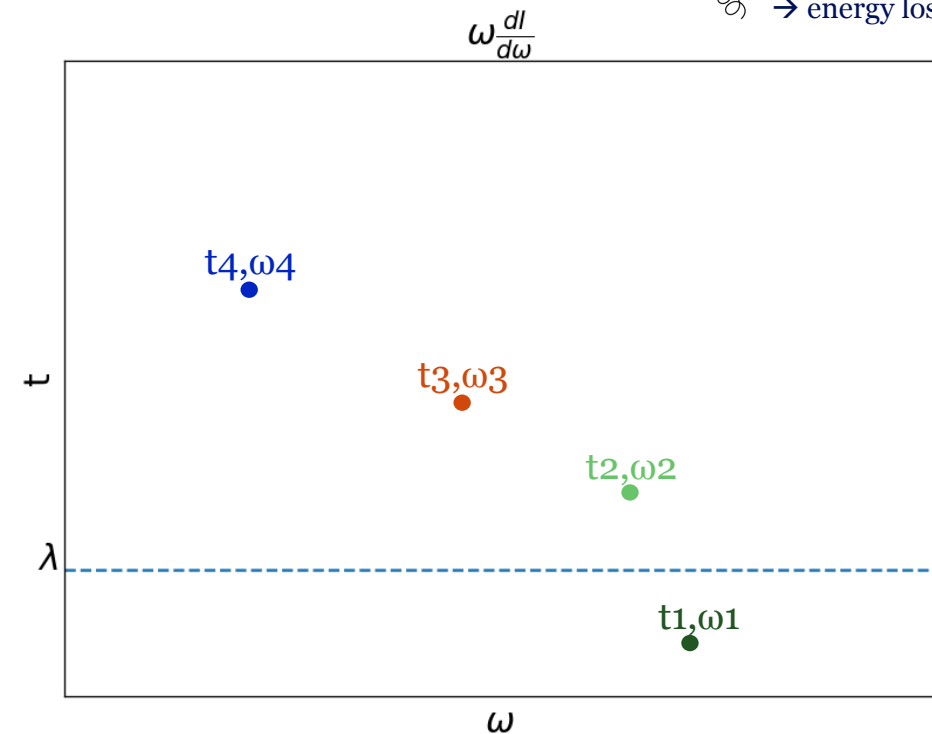

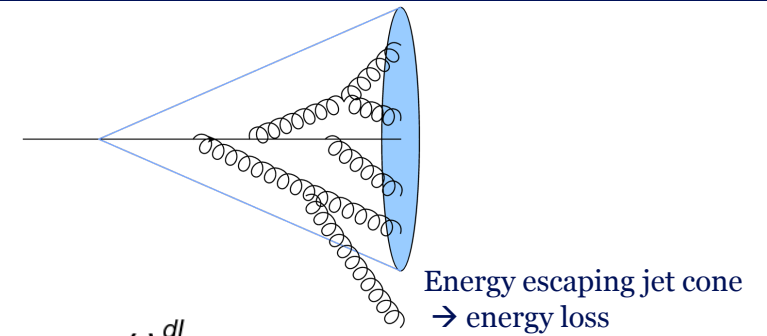

Energy loss in the QGP

- Partons going through the medium scatter with medium constituents
- Scatterings induce emissions
- Emissions lead to radiative energy loss
 - Dominant contribution to energy loss for light quarks and gluons

Energy loss in the QGP

- Partons going through the medium scatter with medium constituents
- Scatterings induce emissions
- Emissions lead to radiative energy loss
 - Dominant contribution to energy loss for light quarks and gluons

- To understand the process we need to zoom in and calculate the emission spectrum for each splitting

Medium induced emissions

- The emission spectrum is given by

$$\omega \frac{dI}{d\omega} = \frac{2\alpha_s C_R}{\omega^2} \text{Re} \int_0^\infty dt_2 \int_0^{t_2} dt_1 \partial_{\mathbf{x}} \cdot \partial_{\mathbf{y}} [\mathcal{K}(\mathbf{x}, t_2; \mathbf{y}, t_1) - \mathcal{K}_0(\mathbf{x}, t_2; \mathbf{y}, t_1)]_{\mathbf{x}=\mathbf{y}=0}$$

- The three-point correlator \mathcal{K} solves the Schrödinger equation

$$\left[i\partial_t + \frac{\partial_{\mathbf{x}}^2}{2\omega} + iv(\mathbf{x}, t) \right] \mathcal{K}(\mathbf{x}, t; \mathbf{y}, t_0) = i\delta(t - t_0)\delta(\mathbf{x} - \mathbf{y})$$

Medium induced emissions

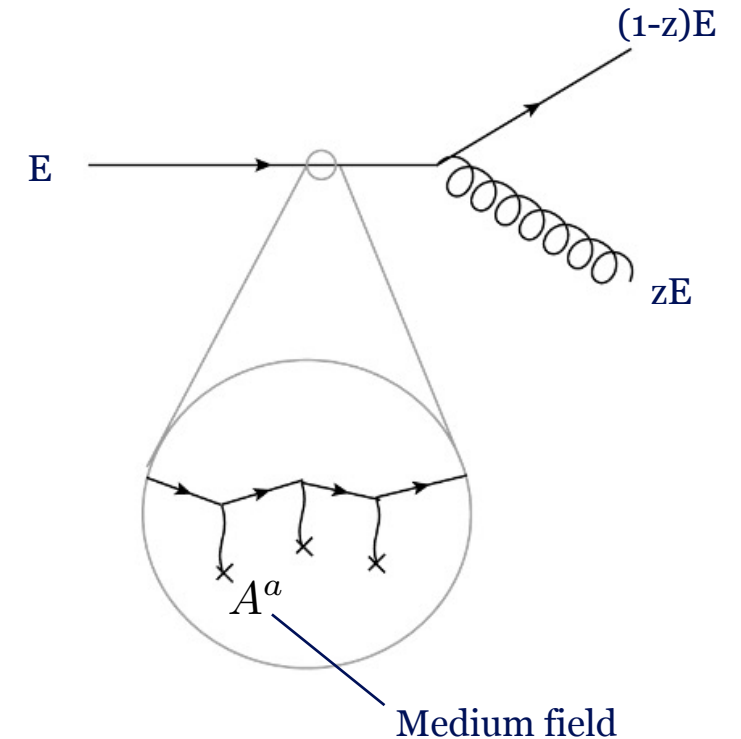

- The emission spectrum is given by

$$\omega \frac{dI}{d\omega} = \frac{2\alpha_s C_R}{\omega^2} \text{Re} \int_0^\infty dt_2 \int_0^{t_2} dt_1 \partial_{\mathbf{x}} \cdot \partial_{\mathbf{y}} [\mathcal{K}(\mathbf{x}, t_2; \mathbf{y}, t_1) - \mathcal{K}_0(\mathbf{x}, t_2; \mathbf{y}, t_1)]_{\mathbf{x}=\mathbf{y}=0}$$

- The three-point correlator \mathcal{K} solves the Schrödinger equation

$$\left[i\partial_t + \frac{\partial_{\mathbf{x}}^2}{2\omega} + iv(\mathbf{x}, t) \right] \mathcal{K}(\mathbf{x}, t; \mathbf{y}, t_0) = i\delta(t - t_0)\delta(\mathbf{x} - \mathbf{y})$$

- Can in general only be evaluated numerically
- Analytical solutions of the spectrum are based on approximations

Medium induced emissions

Two well-known analytical solutions of the spectrum

- Opacity expansion
 - Expand κ in the number of scatterings with the medium
 - Truncate at a finite order

Medium induced emissions

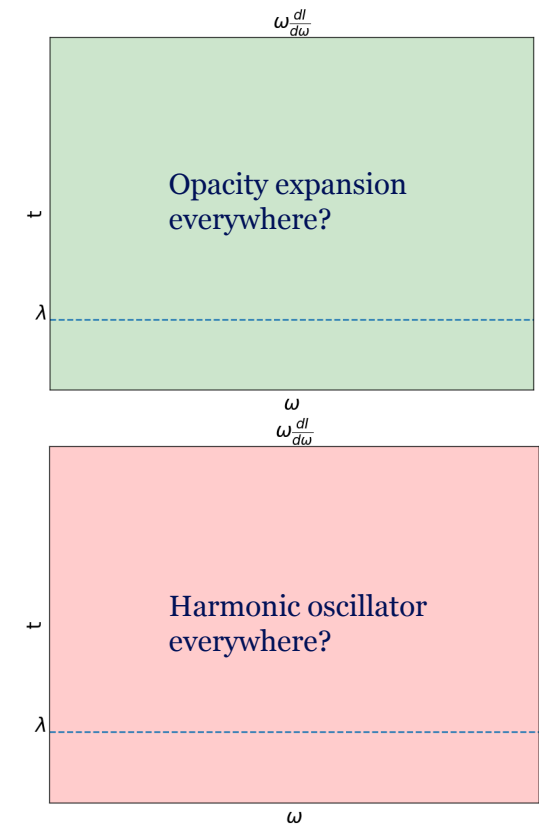

Two well-known analytical solutions of the spectrum

- Opacity expansion
 - Expand κ in the number of scatterings with the medium
 - Truncate at a finite order
- Harmonic oscillator approximation
 - The potential can be approximated as a harmonic oscillator $v(\mathbf{x}, t) \simeq \frac{\hat{q}}{4} \mathbf{x}^2$
 - Can be solved **exactly** to all orders

Medium induced emissions

Two well-known analytical solutions of the spectrum

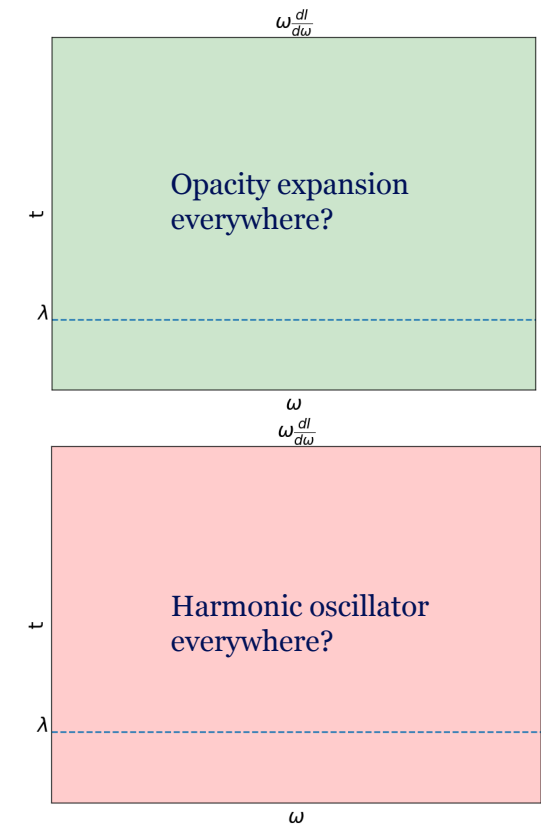

- Opacity expansion
 - Expand κ in the number of scatterings with the medium
 - Truncate at a finite order
- Harmonic oscillator approximation
 - The potential can be approximated as a harmonic oscillator $v(\mathbf{x}, t) \simeq \frac{\hat{q}}{4} \mathbf{x}^2$
 - Can be solved **exactly** to all orders
- Which is correct?

Medium induced emissions

Two well-known analytical solutions of the spectrum

- Opacity expansion
 - Expand κ in the number of scatterings with the medium
 - Truncate at a finite order
- Harmonic oscillator approximation
 - The potential can be approximated as a harmonic oscillator $v(\mathbf{x}, t) \simeq \frac{\hat{q}}{4} \mathbf{x}^2$
 - Can be solved **exactly** to all orders
- Which is correct?
- None of these methods gives satisfying results in the whole phase space
- Combining three expansions gives a very good approximation
 - **Opacity expansion (OE)***
 - **Resummed opacity expansion (ROE)***
 - **Improved opacity expansion (IOE)***

The opacity expansion

- Expansion in scatterings around the vacuum solution \mathcal{K}_0

- The scattering potential contains both a real and virtual part

- The emission spectrum depends on the energy scale $\bar{\omega}_c = \frac{\mu^2 L}{2}$

The opacity expansion

- Expansion in scatterings around the vacuum solution \mathcal{K}_0

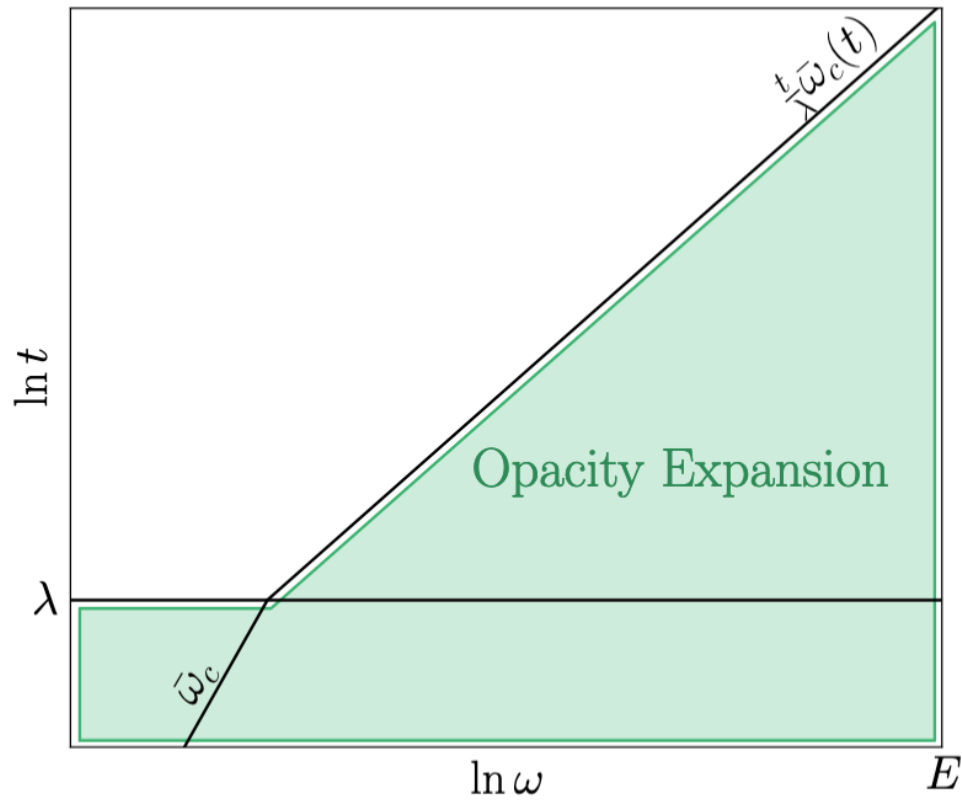

- The scattering potential contains both a real and virtual part

- The emission spectrum depends on the energy scale $\bar{\omega}_c = \frac{\mu^2 L}{2}$
- At **low energy** the spectrum goes as $\sim \left(\frac{L}{\lambda}\right)^n \rightarrow$ convergence when opacity is small $\chi \equiv \frac{L}{\lambda} < 1$
- At **high energy** the spectrum goes as $\sim \left(\frac{L \bar{\omega}_c}{\lambda \omega}\right)^n = \left(\frac{\hat{q}_0 L^2}{2\omega}\right)^n \rightarrow$ convergence when $\omega > \frac{\hat{q}_0 L^2}{2}$

The opacity expansion

- Valid for early times, but also late times if the energy is big
- Breaks down at later times for low energy

Numerical solution from
Andres, Dominguez, Gonzalez Martinez
[2011.06522](#)

The opacity expansion

[2011.06522](#)

- To fill out more of the phase space another expansion is needed

The resummed opacity expansion

- Expand only in **real** scatterings
- All **virtual** scatterings are **resummed** in a Sudakov factor $\Delta(t, t_0) \equiv e^{-\int_{t_0}^t ds \Sigma(s)}$

$$\mathcal{K} \simeq \left(\text{---} \begin{array}{c} \nearrow \text{---} \\ \text{---} \text{---} \end{array} + \text{---} \begin{array}{c} \nearrow \text{---} \\ \text{---} \text{---} \end{array} + \dots \right) e^{-\text{---}}$$

The resummed opacity expansion

- Expand only in **real** scatterings
- All **virtual** scatterings are **resummed** in a Sudakov factor $\Delta(t, t_0) \equiv e^{-\int_{t_0}^t ds \Sigma(s)}$

$$\mathcal{K} \simeq \left(\text{---} \begin{array}{c} \nearrow \text{---} \\ \text{---} \text{---} \end{array} + \text{---} \begin{array}{c} \nearrow \text{---} \\ \text{---} \text{---} \end{array} + \dots \right) e^{-\text{---}}$$

- For short media $L < \lambda$: resummed opacity expansion \rightarrow opacity expansion
- However, also works for longer media $L > \lambda$:
 - New constant scale emerges: $\omega_{\text{BH}} = \frac{\mu^2 \lambda}{2}$

The resummed opacity expansion

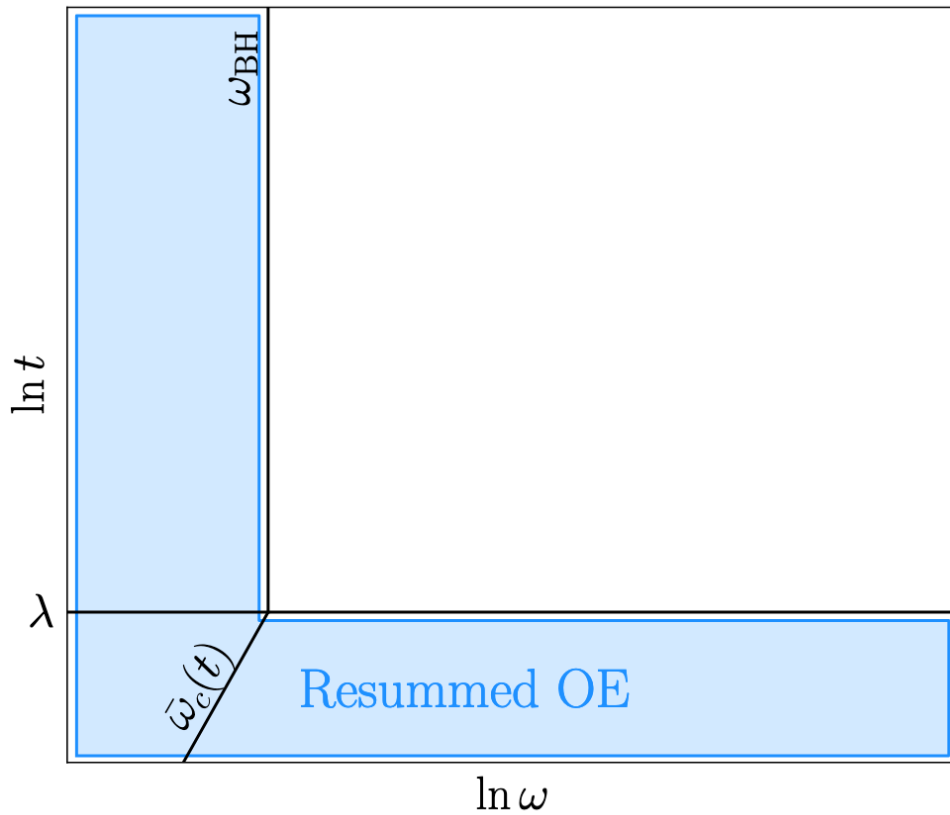

- Expand only in **real** scatterings
- All **virtual** scatterings are **resummed** in a Sudakov factor $\Delta(t, t_0) \equiv e^{-\int_{t_0}^t ds \Sigma(s)}$

$$\mathcal{K} \simeq \left(\text{---} \begin{array}{c} \nearrow \text{---} \\ \text{---} \times \end{array} + \text{---} \begin{array}{c} \nearrow \text{---} \\ \text{---} \times \quad \text{---} \times \end{array} + \dots \right) e^{-\text{---}}$$

- For short media $L < \lambda$: resummed opacity expansion \rightarrow opacity expansion
- However, also works for longer media $L > \lambda$:
 - New constant scale emerges: $\omega_{\text{BH}} = \frac{\mu^2 \lambda}{2}$
- First order contribution leading at low energy: **convergence**
- At high energy $dI^{N_r=2} \sim dI^{N_r=1}$: **no sign of convergence**

The resummed opacity expansion

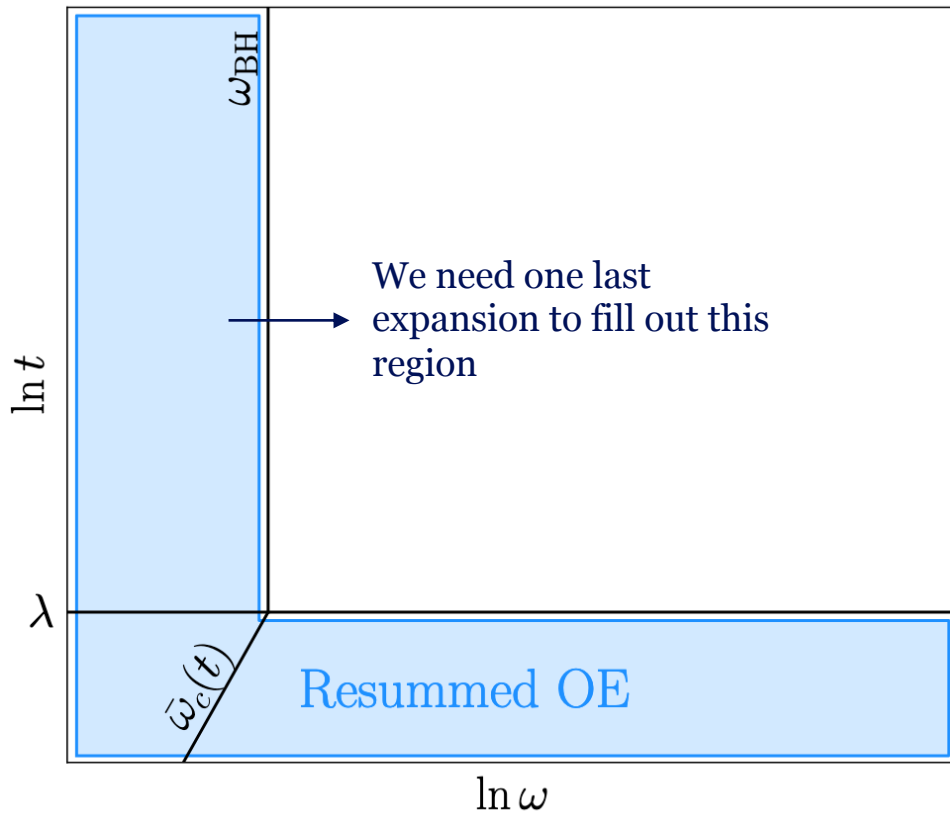

- Valid for:
 - Early times (same as opacity expansion)
 - Late times at low energy (Bethe-Heitler region)

Numerical solution from
Andres, Dominguez, Gonzalez Martinez
[2011.06522](#)

The resummed opacity expansion

- Valid for:
 - Early times (same as opacity expansion)
 - Late times at low energy (Bethe-Heitler region)

Numerical solution from
Andres, Dominguez, Gonzalez Martinez
[2011.06522](#)

The improved opacity expansion

- Comes from manipulating the scattering potential $v(\mathbf{x}, t) \simeq \frac{\hat{q}_0}{4} \mathbf{x}^2 \ln \frac{1}{\mu_*^2 \mathbf{x}^2}$
$$= \frac{\hat{q}}{4} \mathbf{x}^2 + \frac{\hat{q}_0}{4} \mathbf{x}^2 \ln \frac{1}{Q^2 \mathbf{x}^2}$$
$$\equiv v_{\text{HO}}(\mathbf{x}, t) + \delta v(\mathbf{x}, t)$$
- The harmonic oscillator problem is an expansion in **many soft scatterings**
 - Solved **exactly**, resums an arbitrary number of scatterings
 - Can only create emissions with energy up to the emergent scale $\omega_c = \frac{\hat{q} L^2}{2}$
 - Emissions above this scale must be created by harder scatterings, leading to

Harmonic oscillator

The improved opacity expansion

- Comes from manipulating the scattering potential $v(\mathbf{x}, t) \simeq \frac{\hat{q}_0}{4} \mathbf{x}^2 \ln \frac{1}{\mu_*^2 \mathbf{x}^2}$

$$= \frac{\hat{q}}{4} \mathbf{x}^2 + \frac{\hat{q}_0}{4} \mathbf{x}^2 \ln \frac{1}{Q^2 \mathbf{x}^2}$$

$$\equiv v_{\text{HO}}(\mathbf{x}, t) + \delta v(\mathbf{x}, t)$$
- The harmonic oscillator problem is an expansion in **many soft scatterings**
 - Solved **exactly**, resums an arbitrary number of scatterings
 - Can only create emissions with energy up to the emergent scale $\omega_c = \frac{\hat{q} L^2}{2}$
 - Emissions above this scale must be created by harder scatterings, leading to
- The improved opacity expansion
 - Expansion in **hard scatterings** around the **harmonic oscillator** solution
$$\mathcal{K}(\mathbf{x}, t_2; \mathbf{y}, t_1) = \mathcal{K}_{\text{HO}}(\mathbf{x}, t_2; \mathbf{y}, t_1) - \int_{t_1}^{t_2} ds \int_{\mathbf{z}} \mathcal{K}_{\text{HO}}(\mathbf{x}, t_2; \mathbf{z}, s) \delta v(\mathbf{z}, s) \mathcal{K}(\mathbf{z}, s; \mathbf{y}, t_1)$$
- The improved opacity expansion makes it possible to go to higher energies than ω_c

Harmonic oscillator

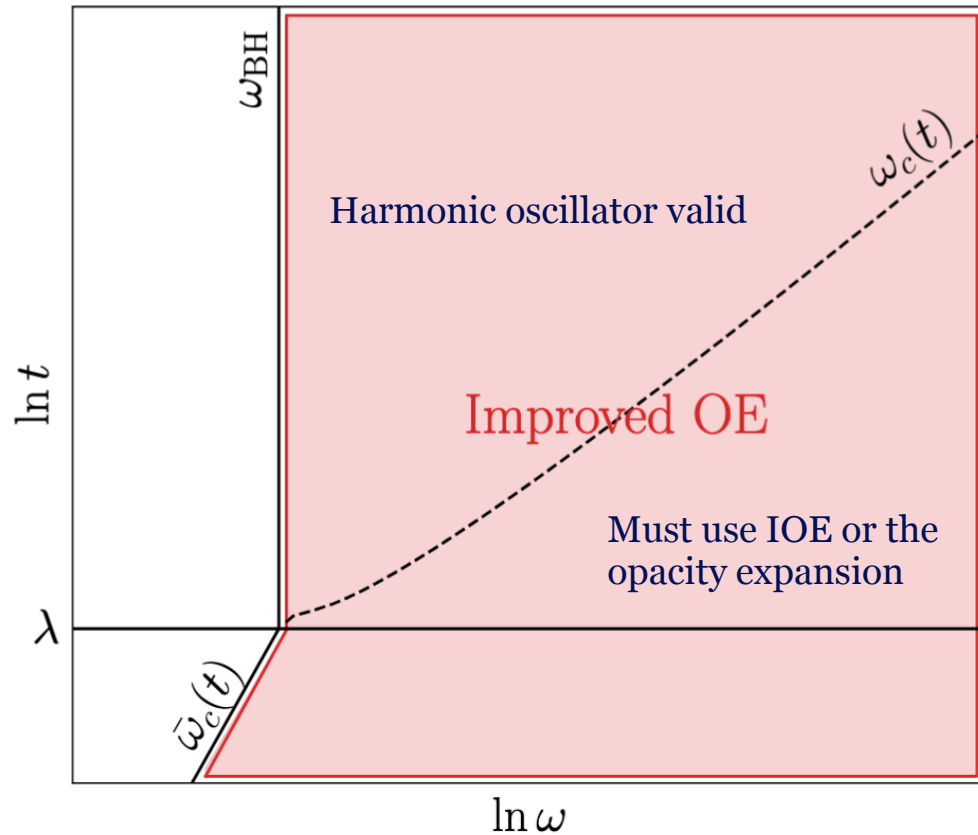

Next-to harmonic oscillator

The improved opacity expansion

- Valid for energies over the Bethe-Heitler regime

Numerical solution from
Andres, Dominguez, Gonzalez Martinez
[2011.06522](#)

Summary of the expansions

- At early times $t < \lambda$ only few scatterings will induce emissions
 - Covered by both the **opacity expansion** and the **resummed opacity expansion**

Summary of the expansions

- At early times $t < \lambda$ only few scatterings will induce emissions
 - Covered by both the **opacity expansion** and the **resummed opacity expansion**
- At intermediate times $\lambda < t < L_c$ three different processes induce emissions
 - Few soft scatterings at low energy $\omega < \omega_{\text{BH}}$ (**resummed opacity expansion**)
 - Multiple coherent scatterings at intermediate energy $\omega_{\text{BH}} < \omega < \omega_c$ (**improved opacity expansion**)
 - Rare hard scatterings at $\omega_c < \omega$ (**opacity expansion** or **improved opacity expansion**)

Summary of the expansions

- At early times $t < \lambda$ only few scatterings will induce emissions
 - Covered by both the **opacity expansion** and the **resummed opacity expansion**
- At intermediate times $\lambda < t < L_c$ three different processes induce emissions
 - Few soft scatterings at low energy $\omega < \omega_{\text{BH}}$ (**resummed opacity expansion**)
 - Multiple coherent scatterings at intermediate energy $\omega_{\text{BH}} < \omega < \omega_c$ (**improved opacity expansion**)
 - Rare hard scatterings at $\omega_c < \omega$ (**opacity expansion** or **improved opacity expansion**)
- At late times $t > L_c = \sqrt{E/(2\hat{q})}$ rare hard scatterings stop playing a part

Summary of the expansions

- At early times $t < \lambda$ only few scatterings will induce emissions
 - Covered by both the **opacity expansion** and the **resummed opacity expansion**
- At intermediate times $\lambda < t < L_c$ three different processes induce emissions
 - Few soft scatterings at low energy $\omega < \omega_{\text{BH}}$ (**resummed opacity expansion**)
 - Multiple coherent scatterings at intermediate energy $\omega_{\text{BH}} < \omega < \omega_c$ (**improved opacity expansion**)
 - Rare hard scatterings at $\omega_c < \omega$ (**opacity expansion** or **improved opacity expansion**)
- At late times $t > L_c = \sqrt{E/(2\hat{q})}$ rare hard scatterings stop playing a part

- Three energy scales naturally emerge from the expansions: $\bar{\omega}_c = \frac{\mu^2 L}{2}$ $\omega_{\text{BH}} = \frac{\mu^2 \lambda}{2}$ $\omega_c = \frac{\hat{q} L^2}{2}$

Summary of the expansions

- For the full line we have used the **ROE** and **IOE**, with a smoothening transition function
- Error is biggest at the transitions between the areas, expect that higher orders make it smoother

Numerical solution from Andres, Dominguez, Gonzalez Martinez [2011.06522](#)

Multiple emissions

- Must take into account the possibility of multiple emissions
- Define the energy distribution of partons with energy xE after travelling time t in the medium:

$$D(x, t) \equiv x \frac{dN}{dx}$$

Multiple emissions

- Must take into account the possibility of multiple emissions
- Define the energy distribution of partons with energy xE after travelling time t in the medium:

$$D(x, t) \equiv x \frac{dN}{dx}$$

- Multiple emissions are resummed in a rate equation

$$\frac{\partial}{\partial t} D(x, t) = \int_x^1 dz 2P\left(z, \frac{x}{z}E, t\right) D\left(\frac{x}{z}, t\right) - \int_0^1 dz P(z, xE, t) D(x, t)$$

- The splitting rate is simply $P(z, E, t) = \left. \frac{dI}{dzdt} \right|_E$
- Follows directly from the emission spectrum

The energy distribution

- At early times $t < \lambda$ there are few emissions
 - Only small modification of the distribution

$t < \lambda$

The energy distribution

- At early times $t < \lambda$ there are few emissions
 - Only small modification of the distribution
- At intermediate times $\lambda < t < L_c$ harmonic oscillator emissions become important
 - More effective transport of energy to soft modes
 - Still residue of early time behavior

$t < \lambda$

$\lambda < t < L_c$

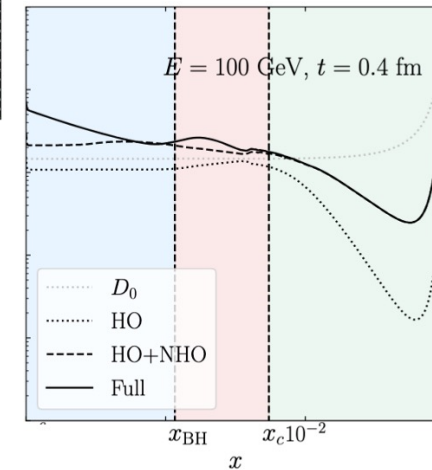

The energy distribution

- At early times $t < \lambda$ there are few emissions
 - Only small modification of the distribution
- At intermediate times $\lambda < t < L_c$ harmonic oscillator emissions become important
 - More effective transport of energy to soft modes
 - Still residue of early time behavior
- At late times $t > L_c$ harmonic oscillator emissions dominate
 - Large modification to the distribution
 - Turbulent cascade of energy to soft modes

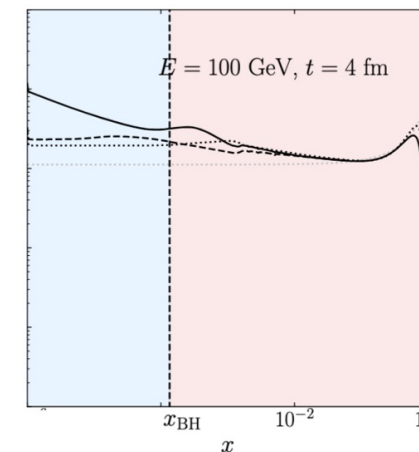

$t < \lambda$

$\lambda < t < L_c$

$t > L_c$

Conclusion and outlook

- Effective theory for the medium induced radiation
 - Good theoretical understanding and control in the different regimes
 - Systematically improvable order by order
- This is achieved through three expansions
 - The **opacity expansion**, the **resummed opacity expansion** and the **improved opacity expansion**
- Three natural energy scales emerge

Conclusion and outlook

- Effective theory for the medium induced radiation

- Three natural energy scales emerge
- Multiple emissions must be taken into account
 - This can be done through a rate equation
 - Better understanding of the time evolution of a jet
- Outlook
 - Get closer to phenomenology by incorporating the vacuum
 - Rigorously define the accuracy of medium induced emissions
 - Incorporating quark masses

Thank you for your attention

Backup

- The limits of the full emission spectrum are

$$\omega \frac{dI}{d\omega} \Big|_{t \ll \lambda} = \begin{cases} 2\bar{\alpha} \frac{L}{\lambda} \left(\ln \frac{\bar{\omega}_c}{\omega} - 1 + \gamma_E \right), & \text{for } \omega \ll \bar{\omega}_c(t) \quad ** \\ \frac{\pi}{2} \bar{\alpha} \frac{L}{\lambda} \frac{\bar{\omega}_c}{\omega}, & \text{for } \bar{\omega}_c(t) \ll \omega \quad *** \end{cases}$$

$$\omega \frac{dI}{d\omega} \Big|_{t \gg \lambda} = \begin{cases} 2\bar{\alpha} \frac{L}{\lambda} \ln \left(\frac{\omega_{\text{BH}}}{\omega} \right), & \text{for } \omega \ll \omega_{\text{BH}}, \quad * \\ \bar{\alpha} \sqrt{\frac{2\omega_c}{\omega}}, & \text{for } \omega_{\text{BH}} \ll \omega \ll \omega_c(t) \quad * \\ \frac{\pi}{2} \bar{\alpha} \frac{L}{\lambda} \frac{\bar{\omega}_c}{\omega}, & \text{for } \omega_c(t) \ll \omega, \quad ** \end{cases}$$

*Opacity expansion

*Resummed opacity expansion

*Improved opacity expansion

The union of IOE and ROE covers the whole phase space!

Backup

- Analytic energy distributions

- Early time

$$D(x, t) \simeq \begin{cases} 2\bar{\alpha} \frac{t}{\lambda} \frac{1}{1-x} \ln \left(\frac{\bar{\omega}_c(t)}{x(1-x)E} \right) & \text{for } x \ll \bar{x}_c, \\ \frac{\pi\bar{\alpha}}{4} \frac{\hat{q}_0}{E} \frac{t^2}{x(1-x)^2} & \text{for } \bar{x}_c \ll x \ll 1 - \bar{x}_c \end{cases}$$

- Late time

$$D_0(x, \tau) = \frac{\tau}{\sqrt{x}(1-x)^{3/2}} e^{-\pi \frac{\tau^2}{1-x}}$$

- Intermediate time

$$D_1(x, \tau) = \int_0^\tau d\sigma \int_x^1 d\xi \delta P(x, \xi, \sigma) D_0(\xi, \sigma) - \int_0^\tau d\sigma D_0(x, \sigma) \int_0^x d\xi \delta P(\xi, x, \sigma)$$

$$\delta P(x, \xi, \tau) = (P_{\text{hard}}(x, \xi, \tau) - P_{\text{coh}}(x, \xi, \tau)) \Theta(x - x_c) \Theta(\xi - x_c - x)$$
