Lepton Flavor Violation in a Z' model for the $b \to s$ anomalies

Thursday 29 November 2018 16:55 (25 minutes)

We take an existing model with a massive Z' boson that addresses the anomalies in $b \to s$ transitions and extended it with a non-trivial embedding of neutrino masses. We analyse whether the most relevant lepton flavor violating effects are generally induced by the non-universal interaction associated to the $b \to s$ anomalies or by the new physics associated to the neutrino mass generation.
