Overview of proposed Higgs factories

Summary of ECFA Higgs, Top & ElectroWeak
Factory Workshop (Oct. 2024)

Thomas Bergauer

11 Oct 2024

3rd ECFA workshop on e⁺e⁻ Higgs, Top & ElectroWeak Factories

9–11 October 2024

Sorbonne Université, Campus des Cordeliers, Paris

International Advisory Committee

- Patricia Conde Muino (ISI/JUP)
- Didier Conrard (IN2P3)
- Mogens Dam (Copenhagen NBI)
- Arnoud Ferrari (Stockholm)
- Juan Fuster (Valencia)
- Ekam Gross (Tel Aviv)
- Jorgen D'Hondt (VU Brussels)
- Christophe Grogan (DESY)
- Patrick Janot (CERN)
- Max Klein (Liverpool)
- Christos Leonidopoulos (Edinburgh)
- Celso Martinez-Rivero (Madrid)
- Joachim Menich (CERN)
- Alexandros Nisati (ROME I)
- Aidan Robson (Glasgow)
- Frank Simon (KIT)
- Paris Spiliadis (Athens, CERN, Chair)
- Steinar Stappes (CERN)
- Roberto Tenchini (Fisal)
- Guy Wilkinson (Oxford)
- Andrea Wulzer (Lausanne)

Local Organizing Committee

- Gregorio Bernardi (CNRS/IN2P3, Chair)
- Catherine Biscardi (LZJ Toulouse)
- Gaëlle Boudoul (IFJ Lyon, AICP)
- Vincent Boudry (LLR Palaiseau)
- Paul Coles (IRFU, CEA/Saclay)
- Marco Delmastro (LAPP Annecy)
- Jean-Baptiste De Vivio (LPCS Grenoble)
- Fares Djama (CPHM Marseille)
- Ziad El Bitar (IPHC Strasbourg)
- Giovanni Marchioni (APC Paris, co-Chair)
- Stéphane Monteil (LPC Clermont-Ferrand)
- Nicolas Morange (JCLab Orsay, co-Chair)
- Luc Poggioli (LPNHE Paris)
- Suzanne Gascon-Shaskin (IFJ Lyon)
- Maxim Titov (IRFU, CEA/Saclay)

<https://indico.in2p3.fr/e/ecfa2024>

Administrative and Technical support team

- Luc Petitizon (JCLab Orsay)
- Sylvaine Pleyre (LLR Palaiseau)
- Sarolta Vydelyingum (APC Paris)

FCC

comprehensive long-term programme maximizing physics opportunities

- stage 1: FCC-ee (Z, W, H, $t\bar{t}$) as Higgs factory, electroweak & top factory at highest luminosities
- stage 2: FCC-hh (~ 100 TeV) as natural continuation at energy frontier, pp & AA collisions; e-h option

2020 - 2045

2045 - 2065

2070 -

FCC-ee

| Parameter | Z | WW | H (ZH) | ttbar |
|--|--------------|-------------|-------------|-------------|
| beam energy [GeV] | 45.6 | 80 | 120 | 182.5 |
| beam current [mA] | 1270 | 137 | 26.7 | 4.9 |
| number bunches/beam | 11200 | 1780 | 440 | 60 |
| bunch intensity [10^{11}] | 2.14 | 1.45 | 1.15 | 1.55 |
| SR energy loss / turn [GeV] | 0.0394 | 0.374 | 1.89 | 10.4 |
| total RF voltage 400/800 MHz [GV] | 0.120/0 | 1.0/0 | 2.1/0 | 2.1/9.4 |
| long. damping time [turns] | 1158 | 215 | 64 | 18 |

FCC Detector Concepts

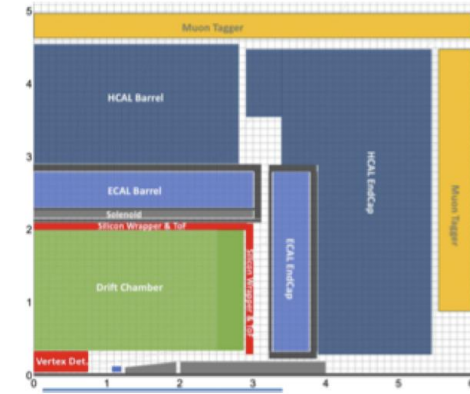

CLD

IDEA

Noble Liquid ECAL based

new

- Well established design
 - ILC -> CLIC detector -> CLD
- Full Si vtx + tracker; CALICE-like calorimetry; large coil, muon system
- Engineering and R&D needed for
 - reduction of tracker material budget
 - operation with continuous beam (no power pulsing: cooling of Si sensors for tracking + calorimetry)
- Possible detector optimizations
 - Improved σ_p/p , σ_E/E
 - PID: timing and/or RICH?

- Less established design
 - But still ~15y history: ILC 4th Concept
- Si vtx detector; ultra light drift chamber w powerfull PID; compact, light coil; monolithic dual readout calorimeter; muon system
 - Possibly augmented by crystal ECAL
- Active community
 - Prototype designs, test beam campaigns, ...

- A design in its infancy
- High granularity Noble Liquid ECAL is core
 - Pb+LAr (or denser W+LCr)
- Drift chamber; CALICE-like HCAL; muon system.
- Coil inside same cryostat as LAr, possibly outside ECAL
- Active Noble Liquid R&D team
 - Readout electrodes, feed-throughs, electronics, light cryostat, ...
 - Software & performance studies

Linear Colliders

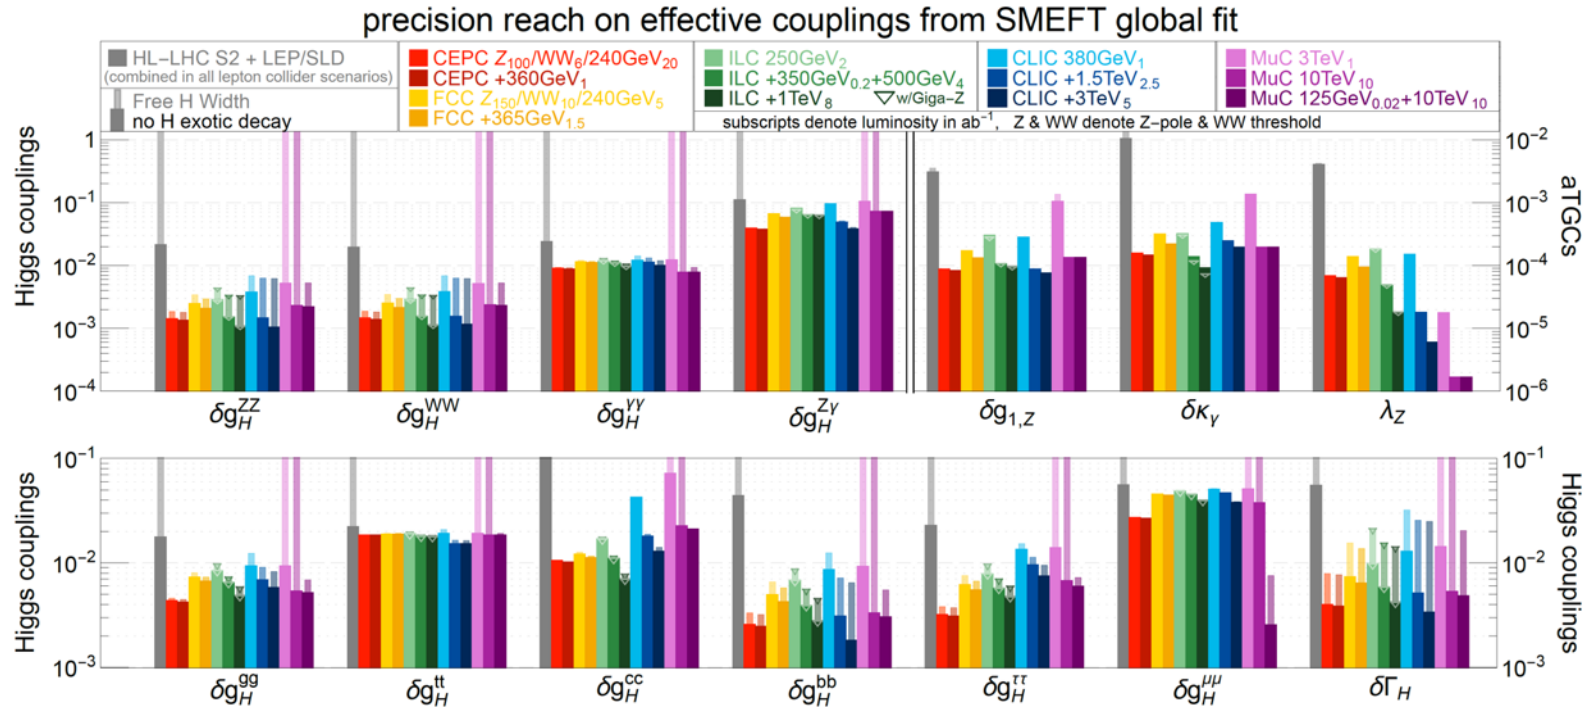

Increased luminosity with energy,
e.g. $1-3 \times 10^{34} \text{ cm}^{-2}\text{s}^{-1}$ for Higgs factories at
250 GeV, 6×10^{34} at 3 TeV

Higher energies “natural” – 3 TeV studied
(for CLIC), but many TeVs challenging:

- Power proportional to luminosity
- Reach up to 50km
- Higher energy means smaller beams and increasingly important beam-beam effects

LC Physics Performance

$e+e-$ colliders show very comparable performance for standard Higgs program, despite quite different assumed integrated luminosities (beam polarization)

- several couplings at few-0.1% level: Z, W, g, b, τ
- some more at $\sim 1\%$: γ , c

[Arxiv: 2206.08326](https://arxiv.org/abs/2206.08326)

ILC

- **250 GeV, $\sim 2\text{ab}^{-1}$:**
 - precision Higgs mass and total ZH cross-section
 - Higgs \rightarrow invisible (Dark Sector portal)
 - basic $f\bar{f}$ and WW program
 - optional: WW threshold scan
- **Z pole, few billion Z's: EWPOs 10-100x better than today**
- **350 GeV, 200 fb^{-1} :**
 - precision top mass from threshold scan
- **500...600 GeV, 4 ab^{-1} :**
 - Higgs self-coupling in ZHH
 - top quark ew couplings
 - top Yukawa coupling incl CP structure
 - improved Higgs, WW and $f\bar{f}$
 - probe Higgsinos up to ~ 300 GeV
 - probe Heavy Neutral Leptons up to ~ 600 GeV
- **800...1000 GeV, 8 ab^{-1} :**
 - Higgs self-coupling in VBF
 - further improvements in $t\bar{t}$, $f\bar{f}$, WW,
 - probe Higgsinos up to ~ 500 GeV
 - probe Heavy Neutral Leptons up to ~ 1000 GeV
 - searches, searches, searches, ...

ILC @ Japan:

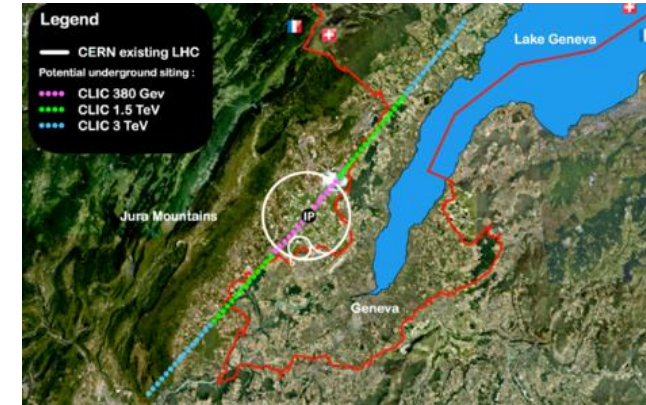

| Quantity | Symbol | Unit | Initial | \mathcal{L} Upgrade |
|----------------------------|----------------------------------|--------------------------------------|---------|-----------------------|
| Centre of mass energy | \sqrt{s} | GeV | 250 | 250 |

| Bunch separation | ns | 0.5 | 0.5 | 0.5 |
| Pulse length | ns | 244 | 244 | 244 |
| Accelerating gradient | MV/m | 72 | 72/100 | 72/100 |
| Total luminosity | $1 \times 10^{34} \text{ cm}^{-2} \text{ s}^{-1}$ | 2.3 | 3.7 | 5.9 |
| Lum. above 99% of \sqrt{s} | $1 \times 10^{34} \text{ cm}^{-2} \text{ s}^{-1}$ | 1.3 | 1.4 | 2 |
| Total int. lum. per year | fb^{-1} | 276 | 444 | 708 |
| Main linac tunnel length | km | 11.4 | 29.0 | 50.1 |
| Nb. of particles per bunch | 1×10^9 | 5.2 | 3.7 | 3.7 |
| Bunch length | μm | 70 | 44 | 44 |
| IP beam size | nm | 149/2.0 | $\sim 60/1.5$ | $\sim 40/1$ |
| Final RMS energy spread | % | 0.35 | 0.35 | 0.35 |
| Crossing angle (at IP) | mrad | 16.5 | 20 | 20 |

- **Compact:** Novel and unique two-beam accelerating technique with high-gradient room temperature RF cavities ($\sim 20'500$ structures at 380 GeV), $\sim 11\text{km}$ in its initial phase
- **Expandable:** Staged programme with collision energies from 380 GeV (Higgs/top) up to 3 TeV (Energy Frontier) presented in previous ESPP updates
- CDR in 2012 with focus on 3 TeV. Updated project overview documents in 2018 (Project Implementation Plan) with focus 380 GeV for Higgs and top.

P5 recommendation (US)

<https://www.usparticlephysics.org/2023-p5-report/full-list-of-recommendations>

- Recommendation 1: As the highest priority [...] complete construction projects and support operations of [...] HL-LHC [...] Belle-II
- Recommendation 2: Plan and start the following major initiatives in order of priority from highest to lowest:
 - CMB-S4 telescopes both the South Pole and Chile
 - A re-envisioned second phase of DUNE
 - An **offshore Higgs factory**, realized in collaboration with international partners, in order to reveal the secrets of the Higgs boson. **The current designs of FCC-ee and ILC meet our scientific requirements.**

P5 Recommendations

We recommend the following:

- 1. As the highest priority independent of the budget scenarios, complete construction projects and support operations of ongoing experiments and research to enable maximum science.** This includes High-Luminosity LHC, the first phase of Deep Underground Neutrino Experiment (DUNE) and Proton Improvement Plan II, the Rubin Observatory to carry out the Legacy Survey of Space and Time (LSST).
- 2. Construct a portfolio of major projects that collectively study nearly all fundamental constituents of our universe and their interactions,** as well as how those interactions determine both the cosmic past and future.
 - a. **CMB-S4**, which looks back at the earliest moments of the universe,
 - b. **Re-envisioned second phase of DUNE** with an early implementation of an enhanced 2.1 MW beam and a third far detector as the definitive long-baseline neutrino oscillation experiment,
 - c. **Offshore Higgs factory, realized in collaboration with international partners**, in order to reveal the secrets of the Higgs boson,
 - d. **Ultimate Generation 3 (G3) dark matter direct detection experiment** reaching the neutrino fog,
 - e. **IceCube-Gen2** for the study of neutrino properties using non-beam neutrinos complementary to DUNE and for indirect detection of dark matter.
- 3. Create an improved balance between small-, medium-, and large-scale projects to open new scientific opportunities and maximize their results, enhance workforce development, promote creativity, and compete on the world stage.** The proposed portfolio includes implementing the recommended program, Advancing Science and Technology using Agile Experiments (ASTAE).
- 4. Support a comprehensive effort to develop the resources—theoretical, computational and technological—essential to our 20-year vision for the field. This includes an aggressive R&D program that, while technologically challenging, could yield revolutionary accelerator designs that chart a realistic path to a 10 TeV parton center-of-momentum (pCM) collider.** In particular, the muon collider option builds on Fermilab strengths and capabilities and supports our aspiration to host a major collider facility in the US.
- 5. Invest in initiatives aimed at developing the workforce, broadening engagement, and supporting ethical conduct in the field.** This commitment nurtures an advanced technological workforce not only for particle physics, but for the nation as a whole.

Other Proposals: CCC

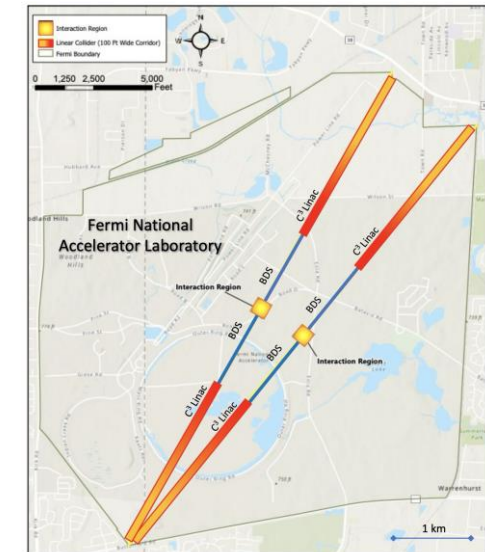

DOI 10.1088/1748-0221/18/07/P07053
and [this talk](#)

- **Cool Copper Collider** is based on a new rf technology
 - Distributed power to each cavity from a common RF manifold
 - Operation at cryogenic temperatures (LN₂ ~80K)
 - High gradient: 120 MeV/m
- Evaluating both underground and surface sites
 - Surface – lower cost and faster to first physics
 - “Fermilab Filler” concept

HL-LHC

Hybrid Asymmetric Linear Higgs Factory Project - HALHF

Schematic layout of HALHF

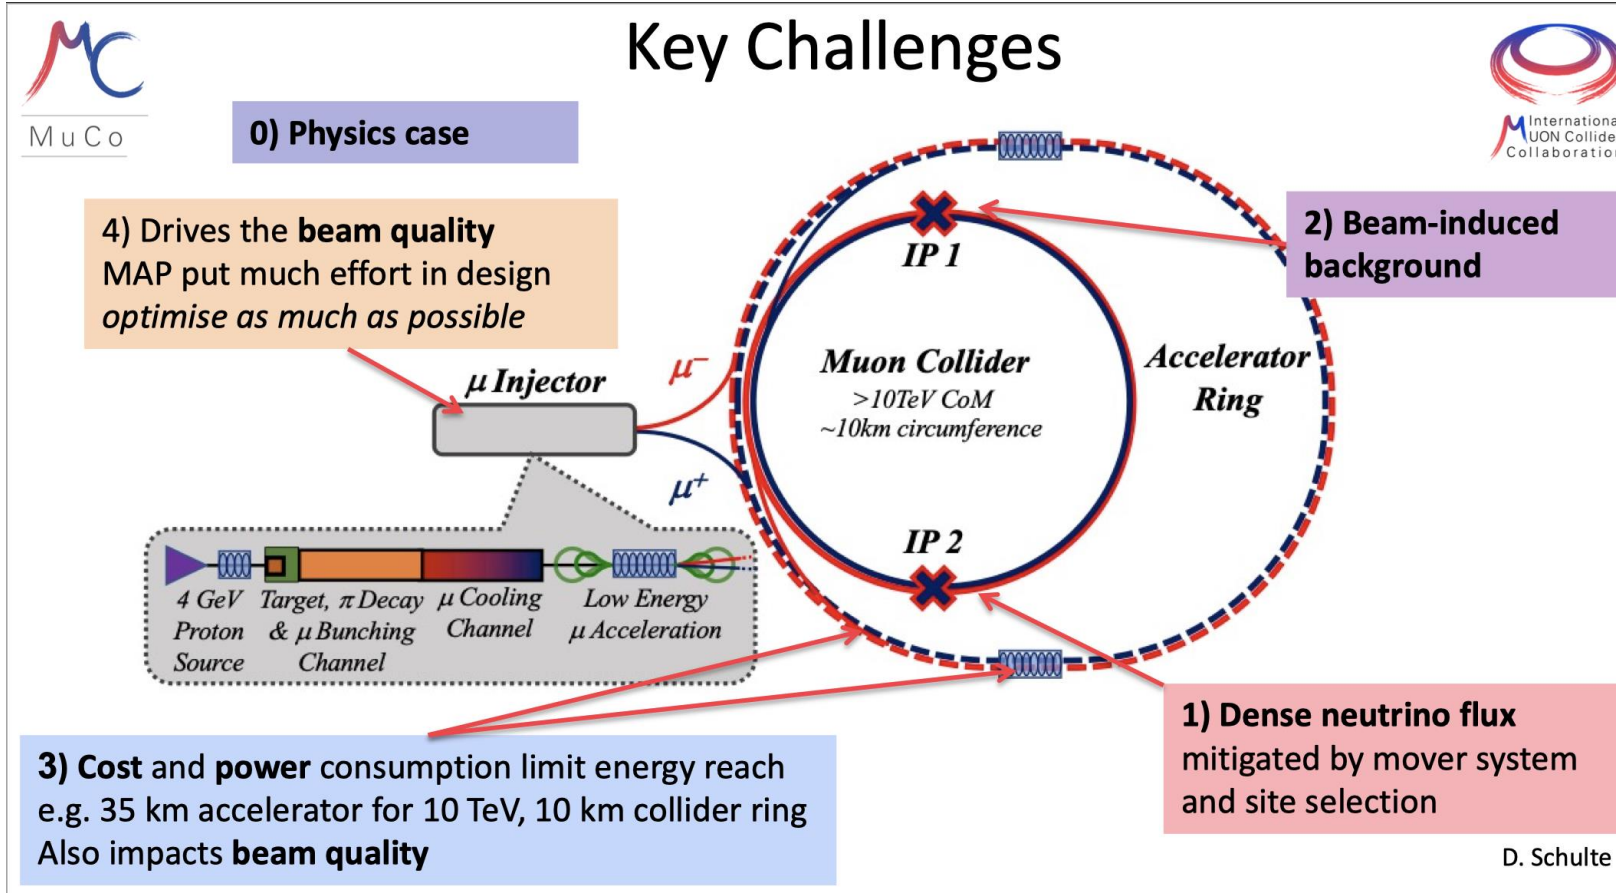

> Overall length: ~3.3 km ⇒ **fits in ~any major particle-physics lab**

> Length dominated by e⁻ beam-delivery system

- **New concept**, aiming for pre-CDR ([LINK](#))
- 500 GeV for electrons with plasma acceleration
- 31 GeV positrons with RF based linac, used also to provide electron drivebeam for the plasma wakefield acceleration
- Reach 250 GeV collision energy, luminosity 10^{34}
- Asymmetric technologies, energies and bunch charges

Muon Collider

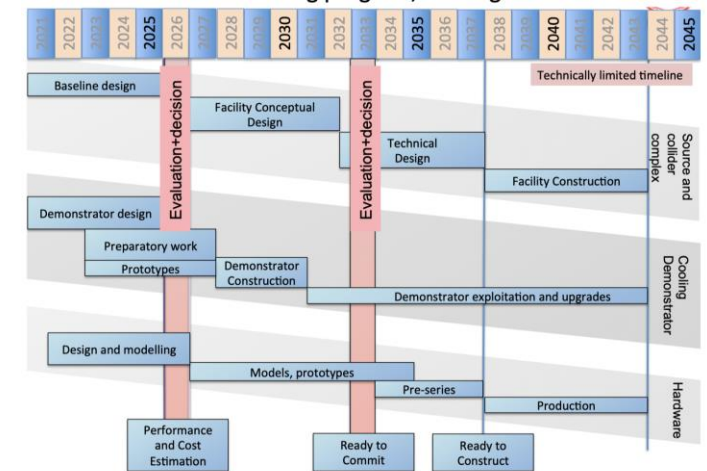

EU Design Study:
<https://mucol.web.cern.ch>

Table 3 Radiation levels per year at a $\sqrt{s} = 1.5$ TeV muon collider and HL-LHC.

| | muon collider | HL-LHC |
|---------------------------------|-------------------------------------|-------------------------------------|
| maximum dose at $R = 2.2$ cm | 10 Mrad | 100 Mrad |
| maximum dose at $R = 150$ cm | 0.1 Mrad | 0.1 Mrad |
| maximum fluence at $R = 2.2$ cm | 10^{15} 1 MeV-neq/cm ² | 10^{15} 1 MeV-neq/cm ² |
| maximum fluence at $R = 150$ cm | 10^{14} 1 MeV-neq/cm ² | 10^{13} 1 MeV-neq/cm ² |

Experiments at Muon collider
([Arxiv 2311.03280](https://arxiv.org/abs/2311.03280))

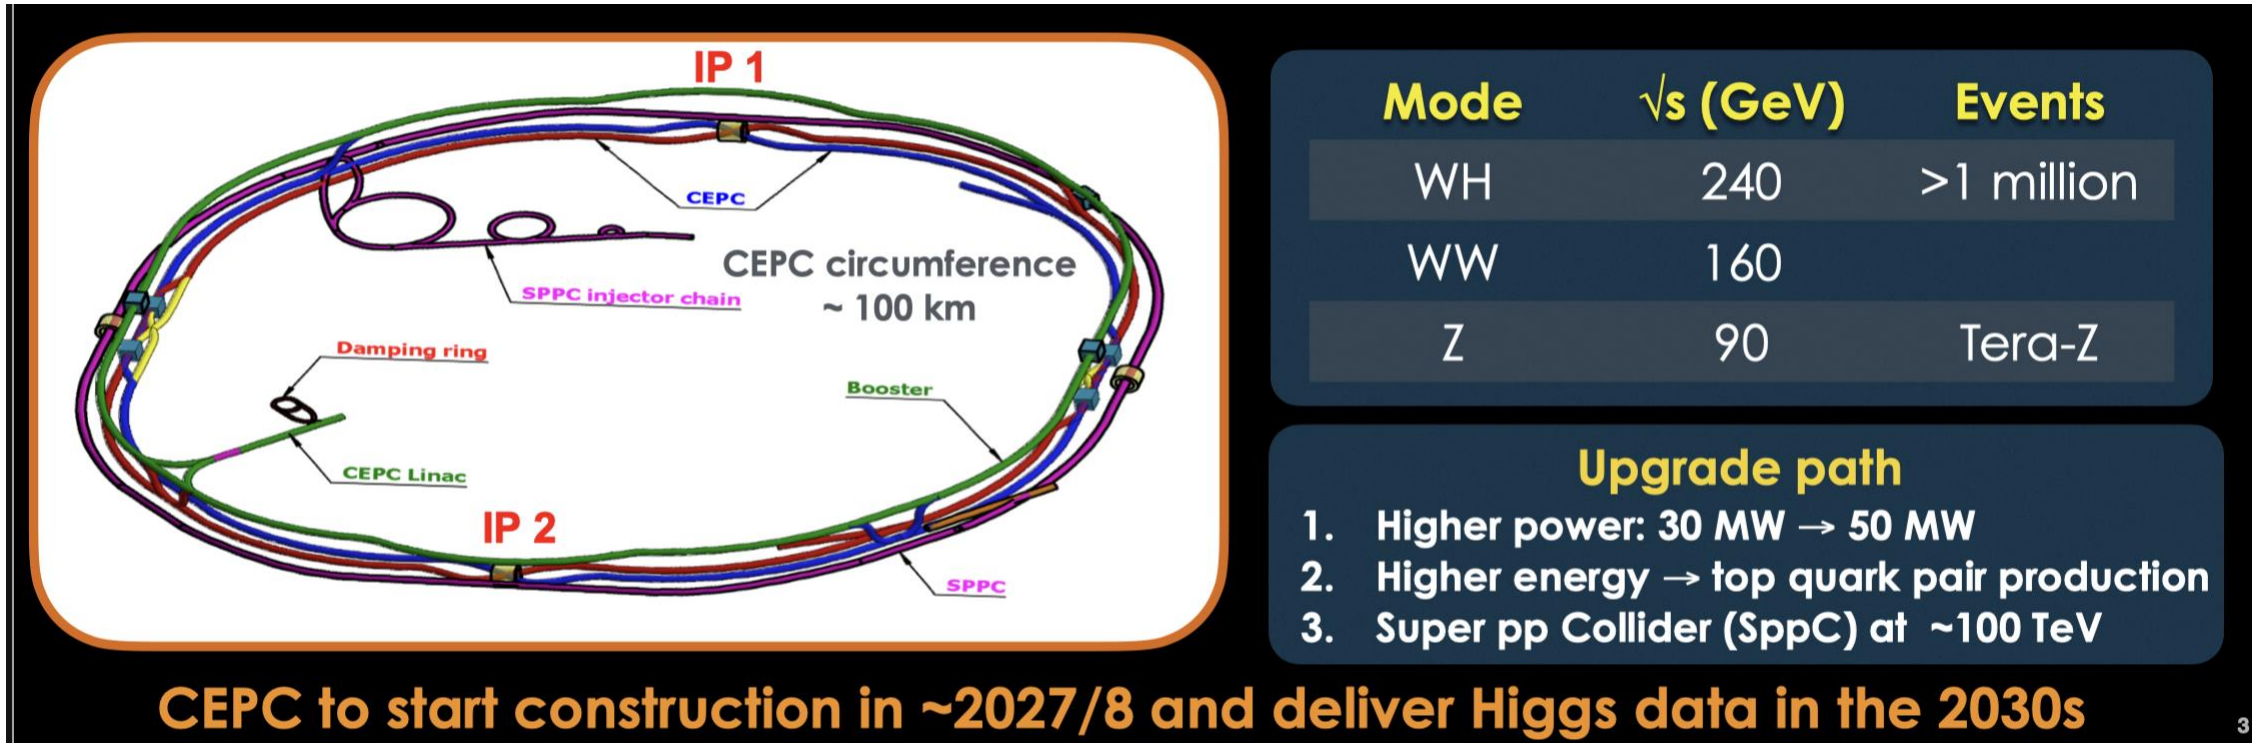

Muon Collider Challenges

- Muon Production: 4GeV Protons on target → Pions → Muons
 - Muon Cooling: Muons generated from pion decay have a broad range of momenta and directions
- Acceleration (max time $2.2\mu\text{s}$): rapid-cycling synchrotrons or linear accelerators
 - High-field superconducting magnets capable of high radiation tolerance.
 - Although muons radiate less synchrotron energy, radiation is generated by decaying muons.
- Decay Products Management: Muons decay into electrons and neutrinos, producing a large flux of secondary radiation.
 - Detectors need to withstand the intense radiation environment from muon decay
 - Neutrino Radiation: The decay of muons results in high-energy, long-range neutrinos

CEPC in China as FCC-ee competitor

- CEPC accelerator TDR has been completed and formally released in Dec. 2023 (arXiv: 2312.14363)
 - Price tag: 5B€

| Circumference (km) | 100 | | | |
| SR power per beam (MW) | 30 | | | |
| Energy (GeV) | 120 | 45.5 | 80 | 180 |
| Bunch number | 268 | 11934 | 1297 | 35 |
| Emittance ϵ_x/ϵ_y (nm/pm) | 0.64/1.3 | 0.27/1.4 | 0.87/1.7 | 1.4/4.7 |
| Beam size at IP σ_x/σ_y (um/nm) | 14/36 | 6/35 | 13/42 | 39/113 |
| Bunch length (natural/total) (mm) | 2.3/4.1 | 2.5/8.7 | 2.5/4.9 | 2.2/2.9 |
| Beam-beam parameters ξ_x/ξ_y | 0.015/0.11 | 0.004/0.127 | 0.012/0.113 | 0.071/0.1 |
| RF frequency (MHz) | 650 | | | |
| Luminosity per IP ($10^{34} \text{ cm}^{-2} \text{ s}^{-1}$) | 5.0 | 115 | 16 | 0.5 |

Running scenarios:

- Higgs** 10 years
- Z** 3 years
- W** 1 year
- ttbar** 5 years

CEPC Site Evaluation

Civil construction cost was evaluated by 3 experienced companies:

Yellow River Engineering Consulting Co., Ltd
HUADONG Engineering Corporation Limited,
ZHONGNAN Engineering Corporation Limited

Three sites were considered: Changsha, Huzhou and Qinhuangdao

International Panel has reviewed the cost evaluation given by the 3 companies

All sites can satisfy requirements for CEPC construction. The main geological problems encountered can be solved by engineering measures.

Advance the civil engineering design as soon as possible.

Decide the site
Complete the project proposal, feasibility study, preliminary design, and tender design before construction

CEPC Approval

CEPC Plan: 15th Five Year Plan — Chinese Academy of Sciences

- CAS planning for the 15th 5-years plan for large science projects
- A steering committee has been established, chaired by the president of CAS
- High energy physics, as one of the 8 groups, accomplished the following:
 - Set up rules and selection standards (based on scientific and technological merits, strategic value and feasibility, R&D status, team and capabilities, etc.); established domestic and international advisory committees
 - 9 proposal selected (from 15 submitted)
 - Evaluations and ranking by committees after oral presentations by each project
- **CEPC was ranked No. 1, with the smallest uncertainties, by every committee**
- A final report was submitted to CAS for consideration

ECFA Questions and CEPC

- Should CERN/Europe proceed with the preferred option set out in 3a) or should alternative options be considered:
 - if Japan proceeds with the ILC, China proceeds with the CEPC or if the US proceeds with a muon collider?
 - if there are major new (unexpected) results from the HL-LHC or other HEP experiments?

Higgs factories

ECFA Questions

- 3) Questions to be considered by countries/regions when forming and submitting their “national input” to the ESPP:
 - 3a) Which is the preferred next major/flagship collider project for CERN?
 - 3b) What are the most important elements in the response to 3a)?
 - Physics potential, Long-term perspective , Financial and human resources: requirements and effect on other projects, Timing, Careers and training , Sustainability
- 4) What other areas of physics should be pursued, and with what relative priority? (preferred prioritisation for non-collider projects)
 - To what extent should CERN participate in nuclear physics, astroparticle physics or other areas of science, while keeping in mind and adhering to the CERN Convention? Please use the current level and form of activity as the baseline for comparisons.

Summary

- Last Strategy update recommended Higgs factory as the highest priority to follow the LHC, while pursuing a technical and financial feasibility study for a next-generation hadron collider in parallel, in preparation for the long-term
- **Now its about deciding on a facility.**
 - Strategy update is about 6-7 years
 - Only a realistic machine should be proposed, if start of construction is considered “now”
 - If we “sit and wait” also other options can be considered
- Other input proposals expected: LHeC, extend HL-LHC runtime
- Biggest elephant in the room is the Chinese decision to include CEPC in 5-years plan in 2025 → then Europe is only 2nd and the question for alternative concepts arises
