MAGIC23 Workshop (Matter, Astrophysics, Gravitation, Ions and Cosmology)

Contribution ID: 73

Type: Oral

Gravitational waves from isolated magnetized quark stars

We study the effects of magnetic fields on gravitational wave signals emitted from isolated quark stars due to deformation caused by the strong magnetic field. For this purpose we construct a toy model in order to make estimates of the order of magnitude of the magnetic field that will cause sufficient deformation in a quark star for the detection of gravitational waves.
