Photomeson interactions briefly...

...photoproduction of pions resulting in neutrinos

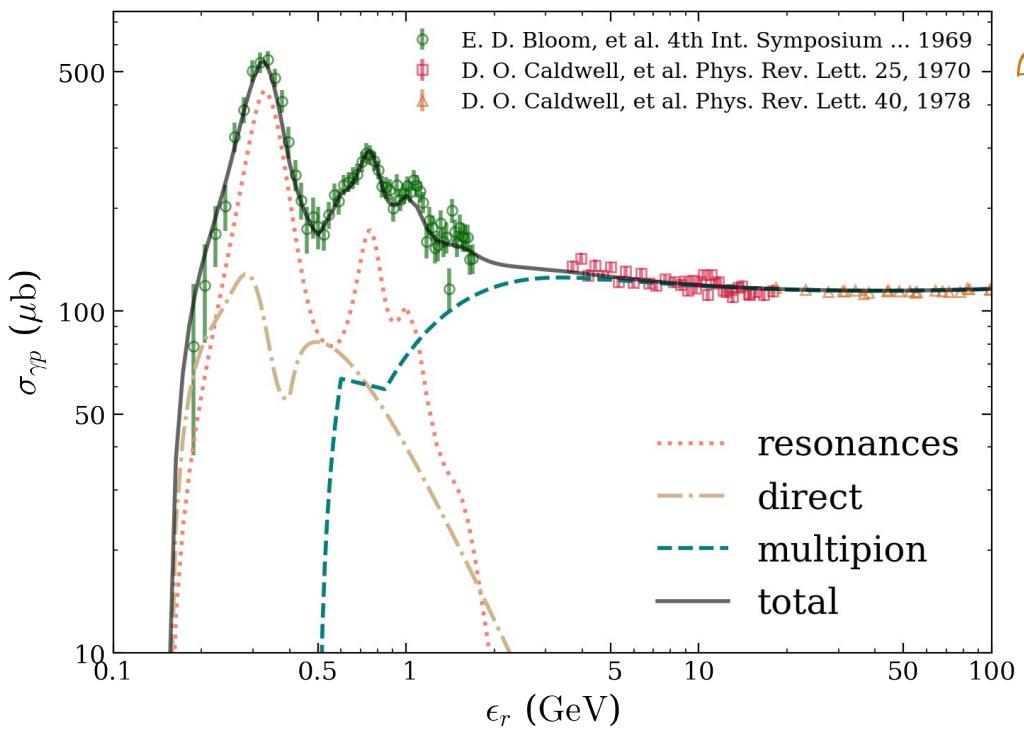

photons and neutrinos

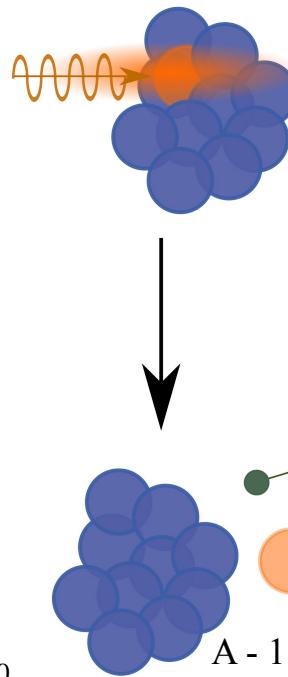

Single-particle model for nuclei

in short: nucleons in nuclei are considered free

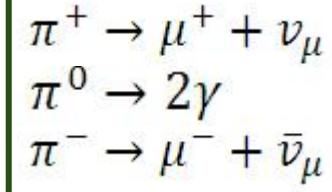

Cross section for photon - proton interactions
vs photon energy (as in SOPHIA)

Ref: LM, A. Fedynitch, D. Boncioli, D. Biehl and W. Winter, JCAP11(2019)007

photons and neutrinos

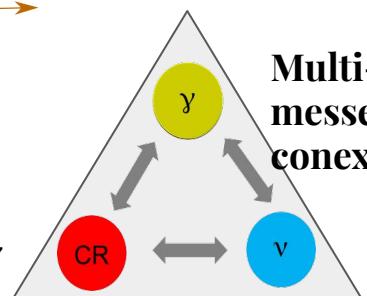

pion(s)

nucleon

A - 1
remnant
nucleus

Multi-
messenger
conexión

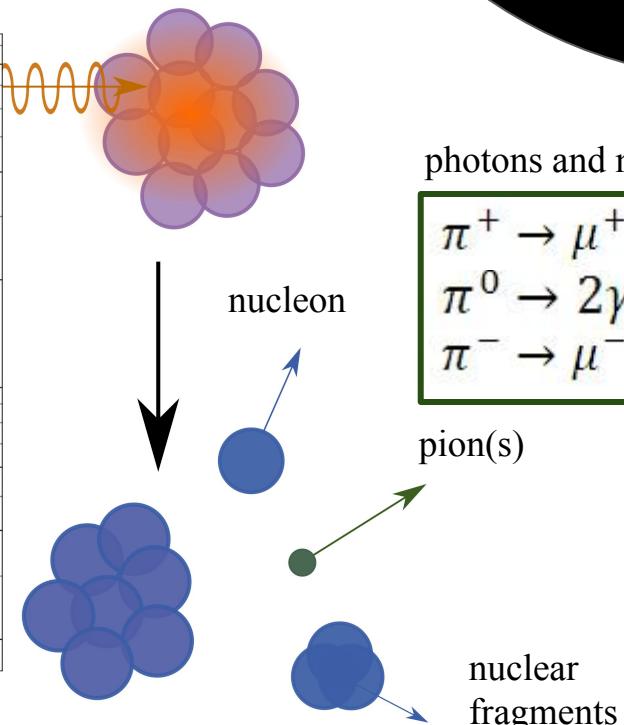

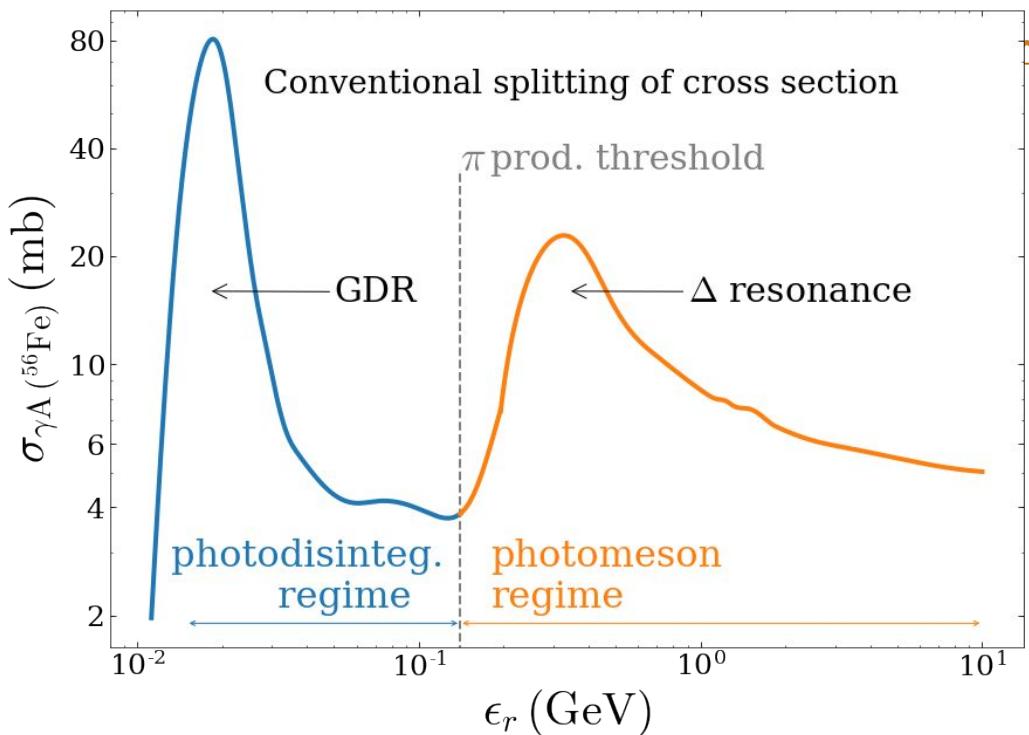

Photomeson interactions for nuclei

Nuclear medium effects not negligible

Schematic cross section for photonuclear interactions vs photon energy

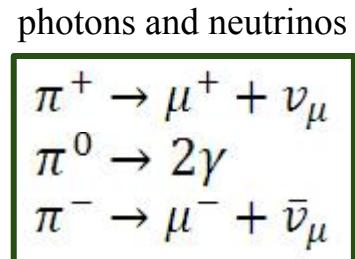

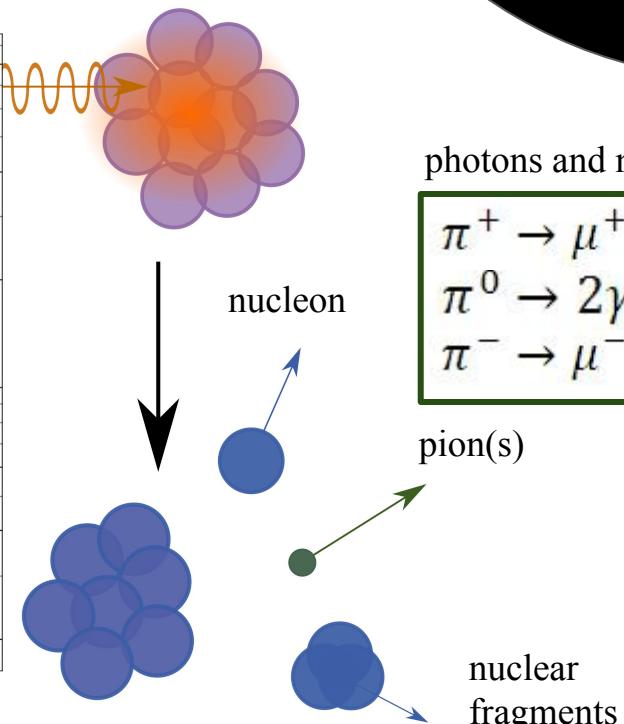

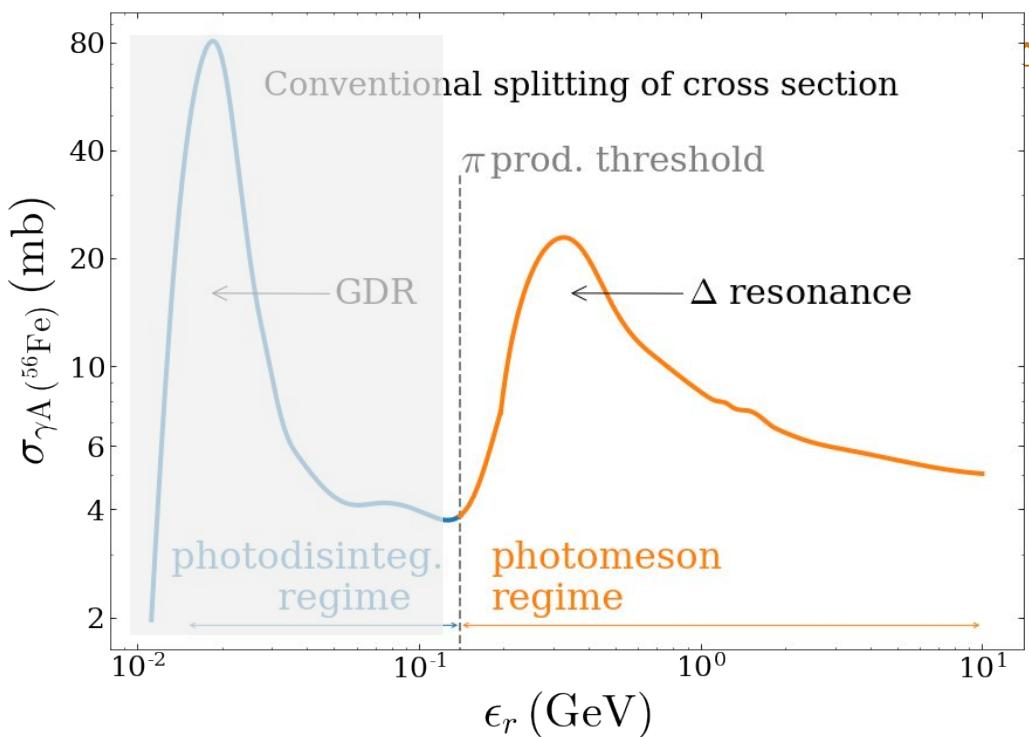

Ref: LM, A. Fedynitch, D. Boncioli, D. Biehl and W. Winter, JCAP11(2019)007

Photomeson interactions for nuclei

Nuclear medium effects not negligible

Schematic cross section for photonuclear interactions vs photon energy

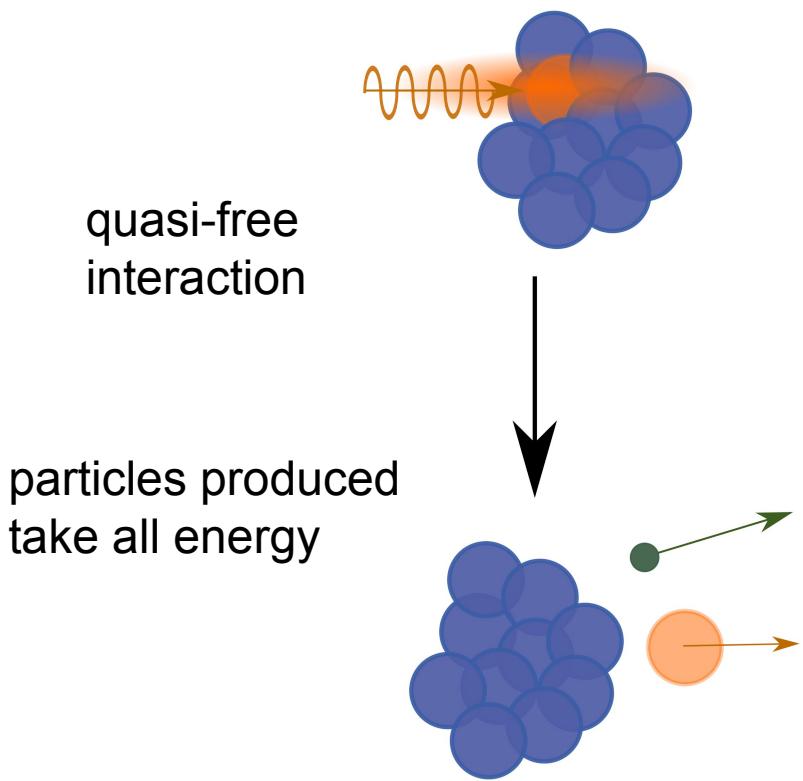

Ref: LM, A. Fedynitch, D. Boncioli, D. Biehl and W. Winter, JCAP11(2019)007

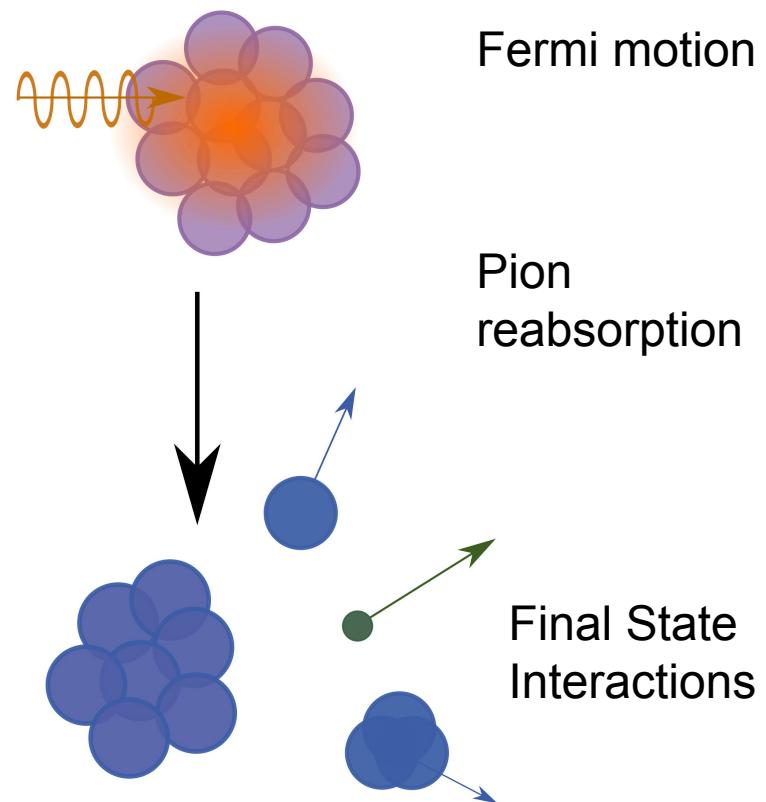

Old vs New model in schematics

Conventions used in what follows

Single Particle Model (SPM)

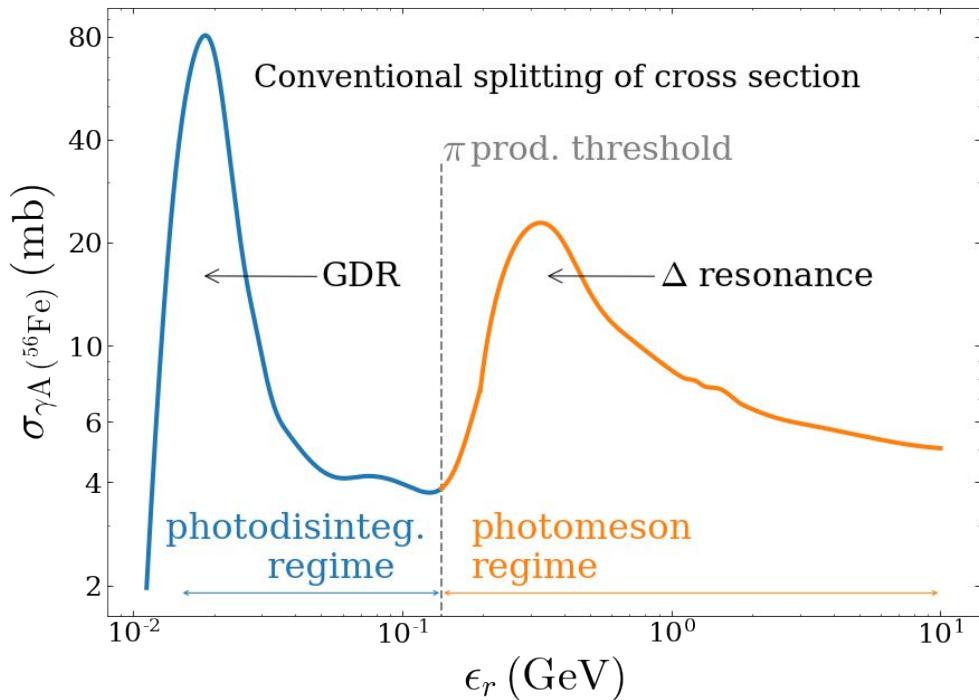

Empirical Model (EPM)

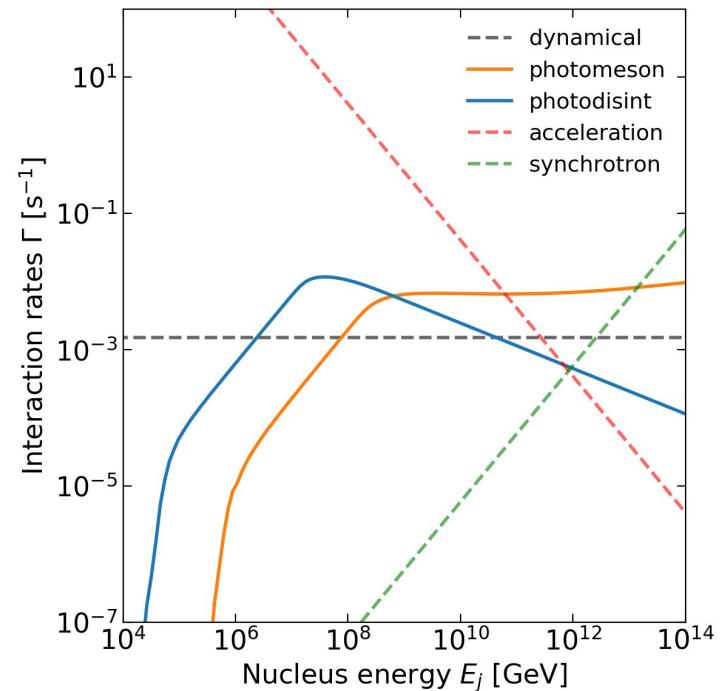

Cross section imprints on interaction rates

In scenarios where photomeson interactions are dominant

Photonuclear interactions with broken power law photon fields

Ref: LM, A. Fedynitch, D. Boncioli, D. Biehl and W. Winter, JCAP11(2019)007

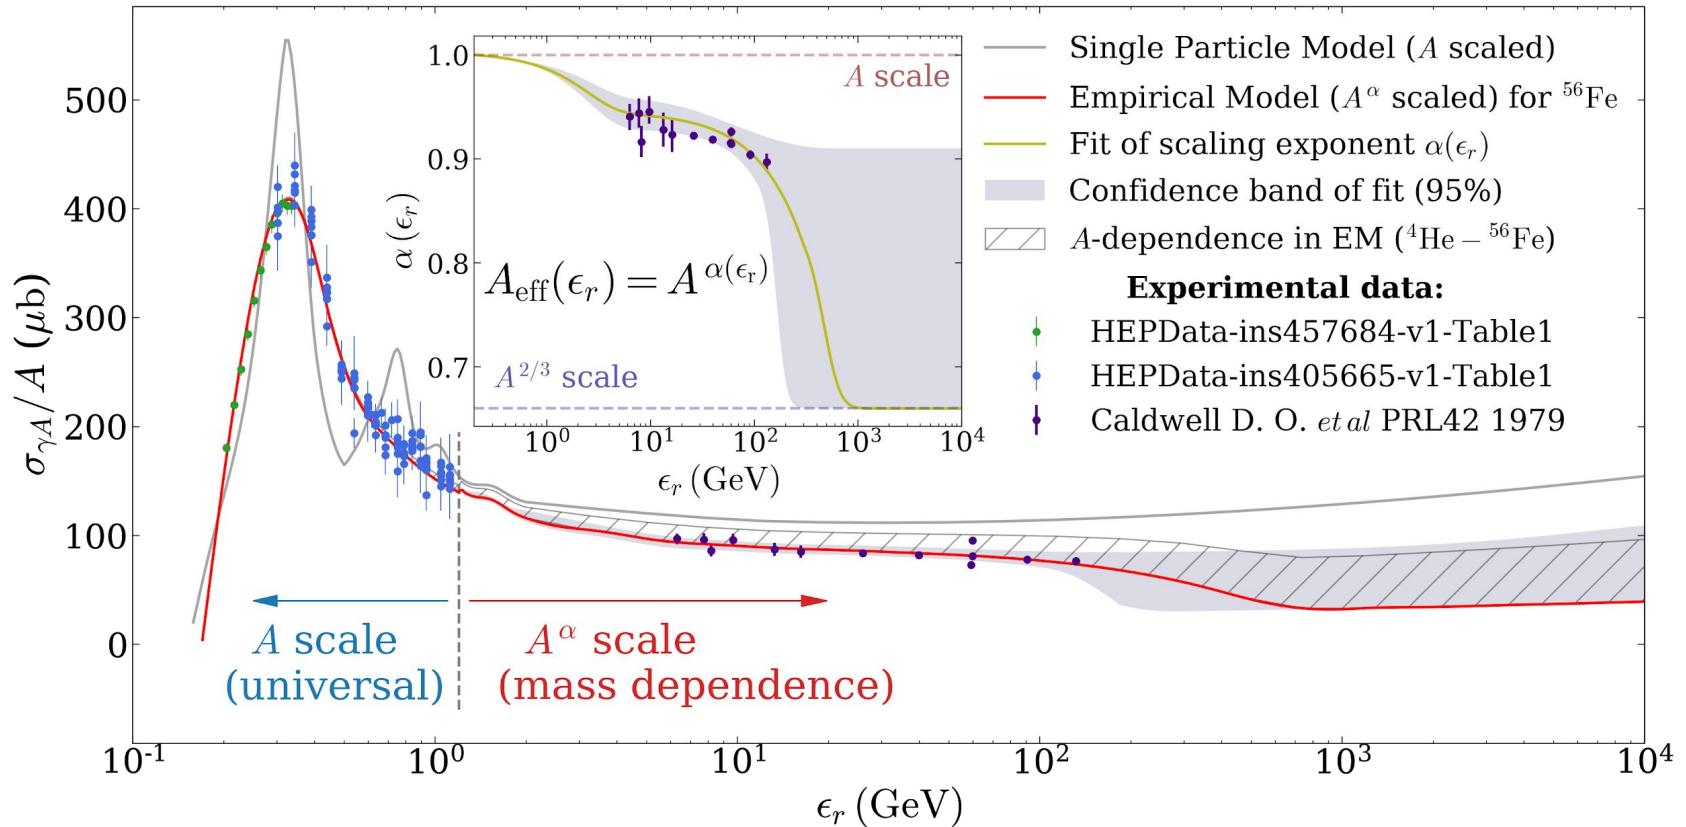

Ref: LM, Poster Presentation TeVPA(2018)

Total cross section

General differences with the free nucleon interaction

Resonances are smeared and shadowing effects occur.

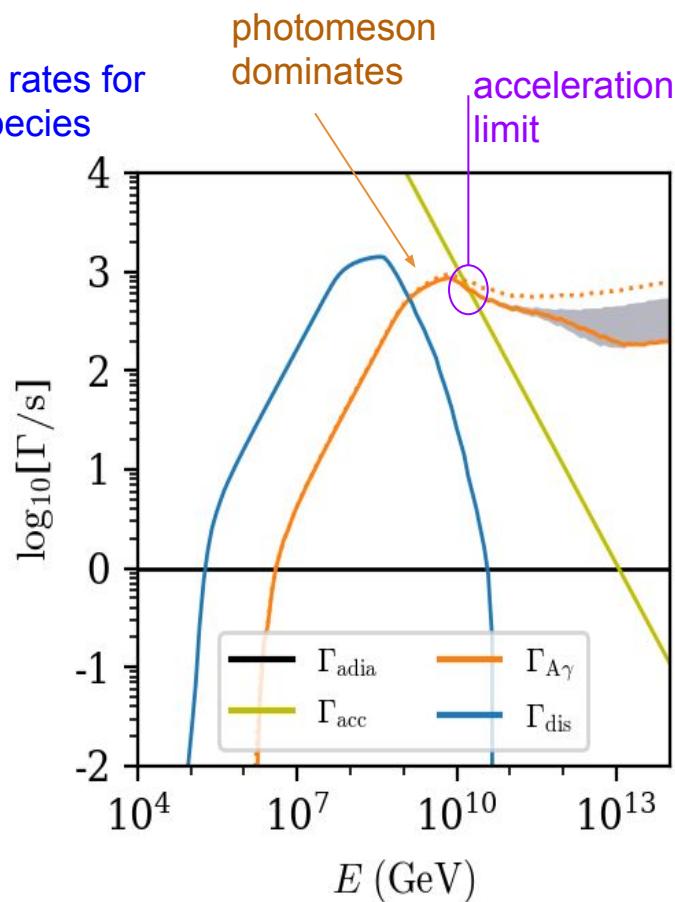

Ref: LM, A. Fedynitch, D. Boncioli, D. Biehl and W. Winter, JCAP11(2019)007

Gamma-Ray Burst source

Impact of the cross section

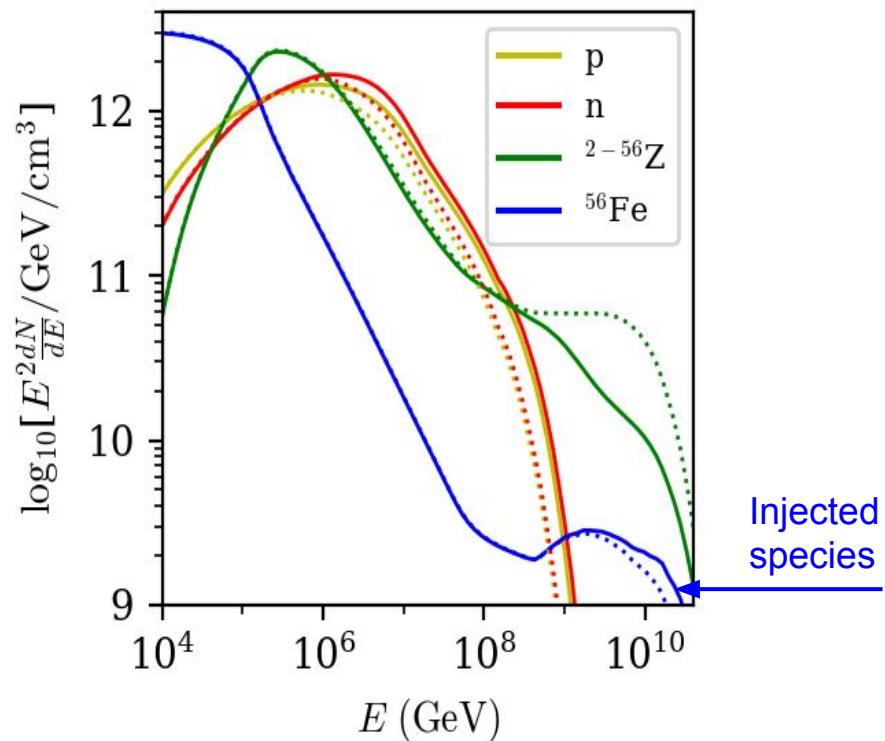

Interaction rates for Injected species

Lower interaction rates at higher energies!

.... Single Particle Model
 — Empirical Model

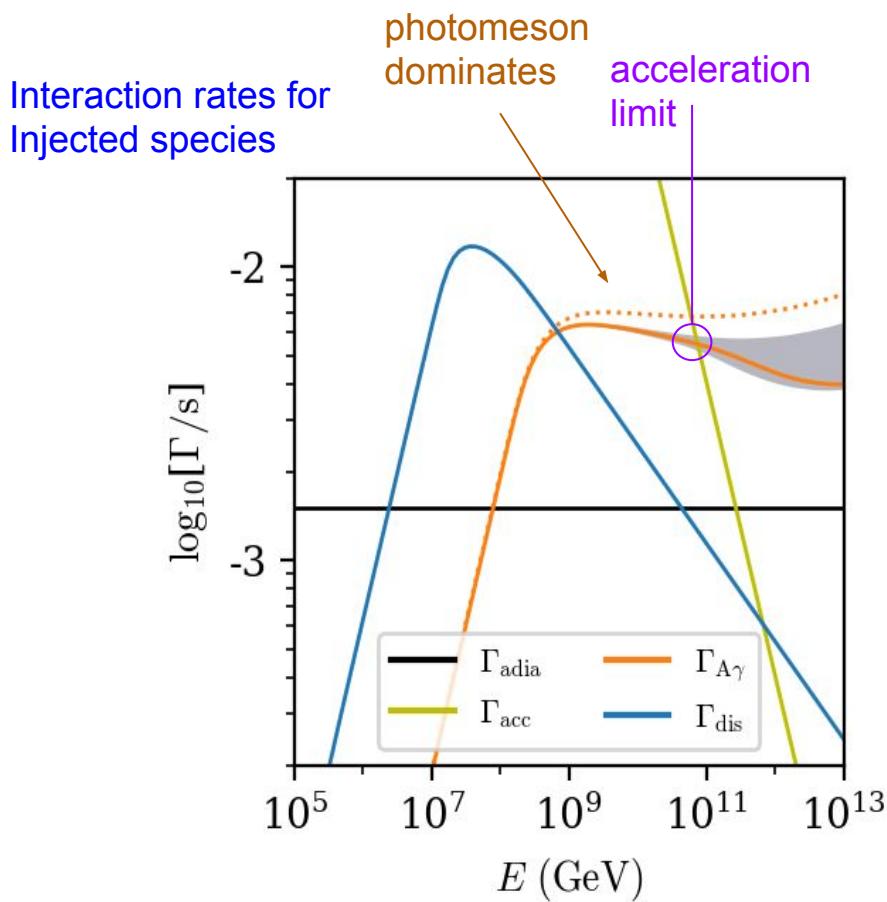

cross section extrapolation

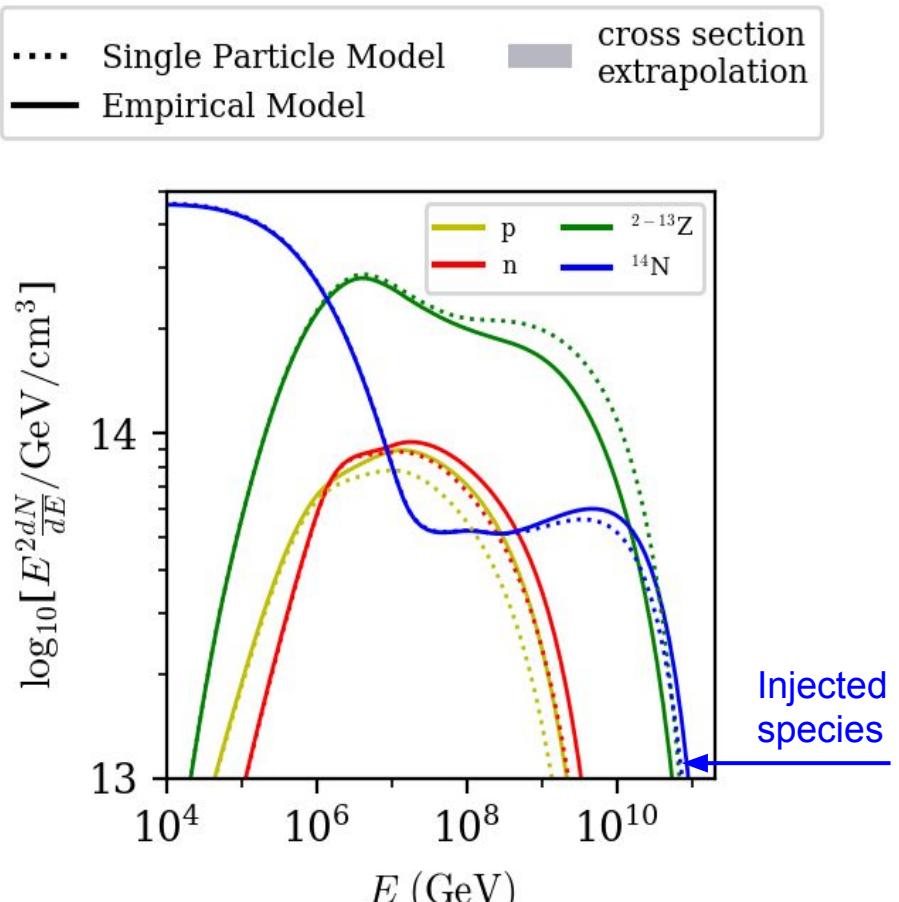

Refs: LM, A. Fedynitch, D. Boncioli, D. Biehl and W. Winter, JCAP 11 (2019) 007
 D. Biehl, D. Boncioli, A. Fedynitch and W. Winter, A&A 611, A101 (2018)

Tidal Disruption Event source

Impact of the cross section

Slightly higher maximal energies!

Ref: LM, A. Fedynitch, D. Boncioli, D. Biehl and W. Winter, JCAP 11 (2019) 007
D. Buehl, D. Boncioli, C. Lunardini and W. Winter Sci Rep 8, 10828 (2018)

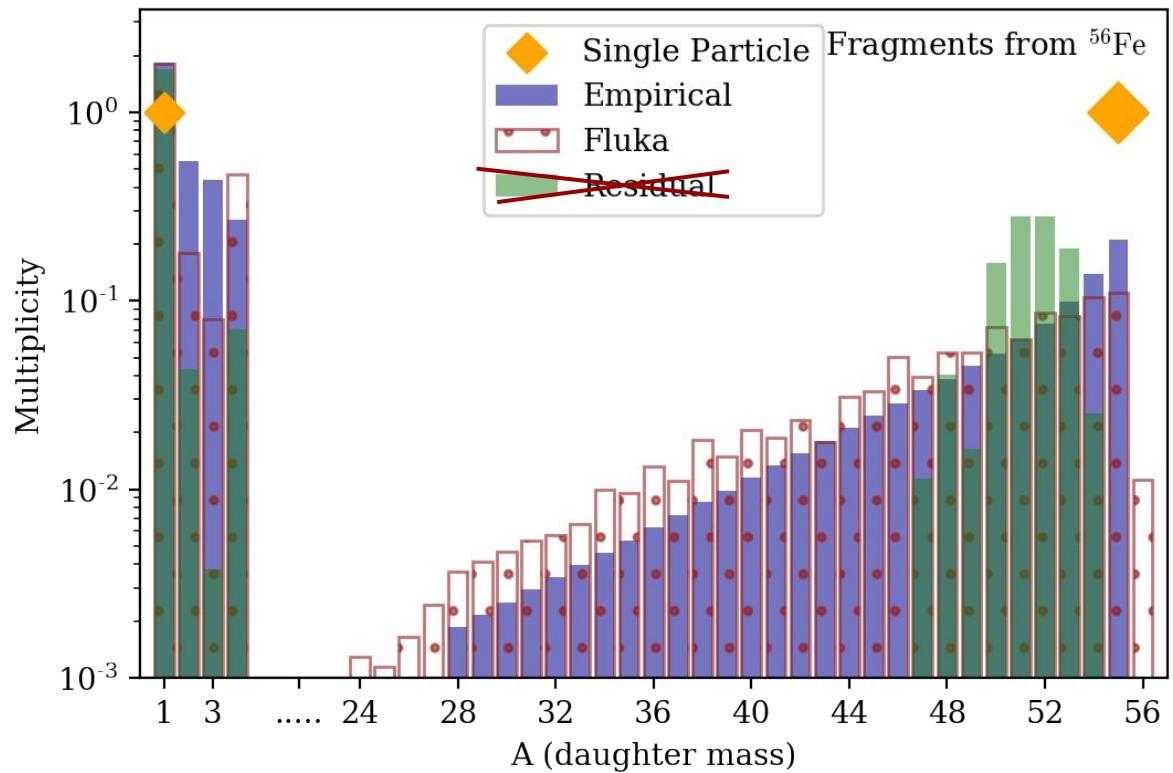

Nuclear breakup: mass distributions

Impact of the nuclear cascade

Larger variability of fragment masses!

Features of the model...

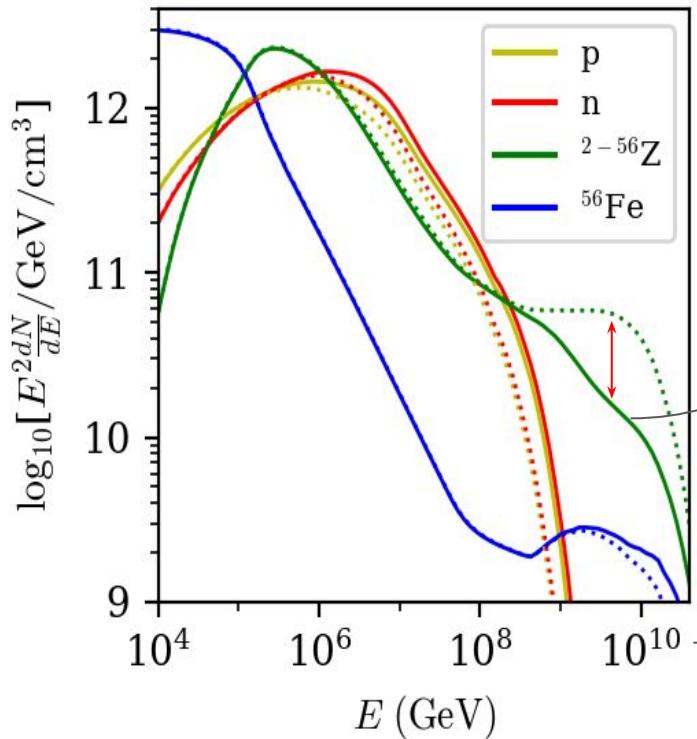

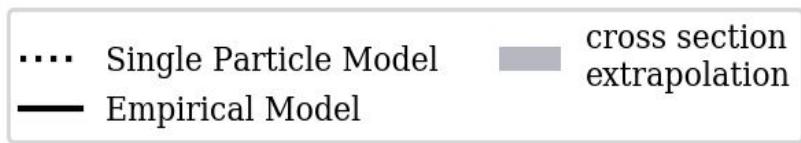

- Fragment production from empirical relations
- Thermostatistics criteria for low-mass fragments
- Insensitive to isotopic charge differences

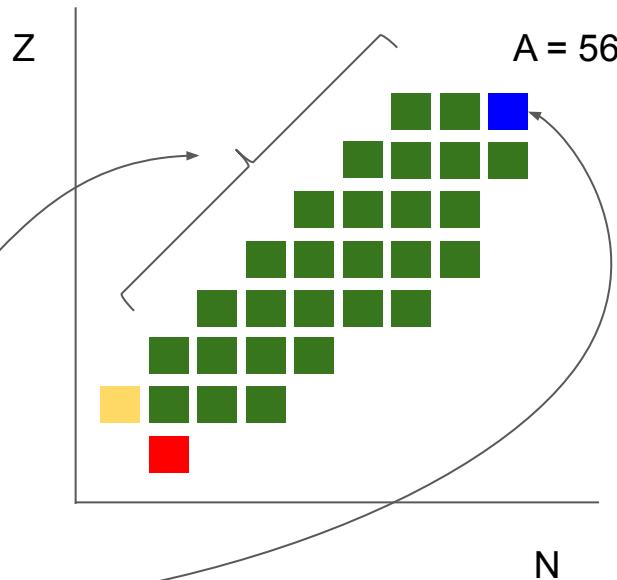

Ref: LM, A. Fedynitch, D. Boncioli, D. Biehl and W. Winter, JCAP11(2019)007

Gamma-Ray Burst source

Impact of the nuclear cascade

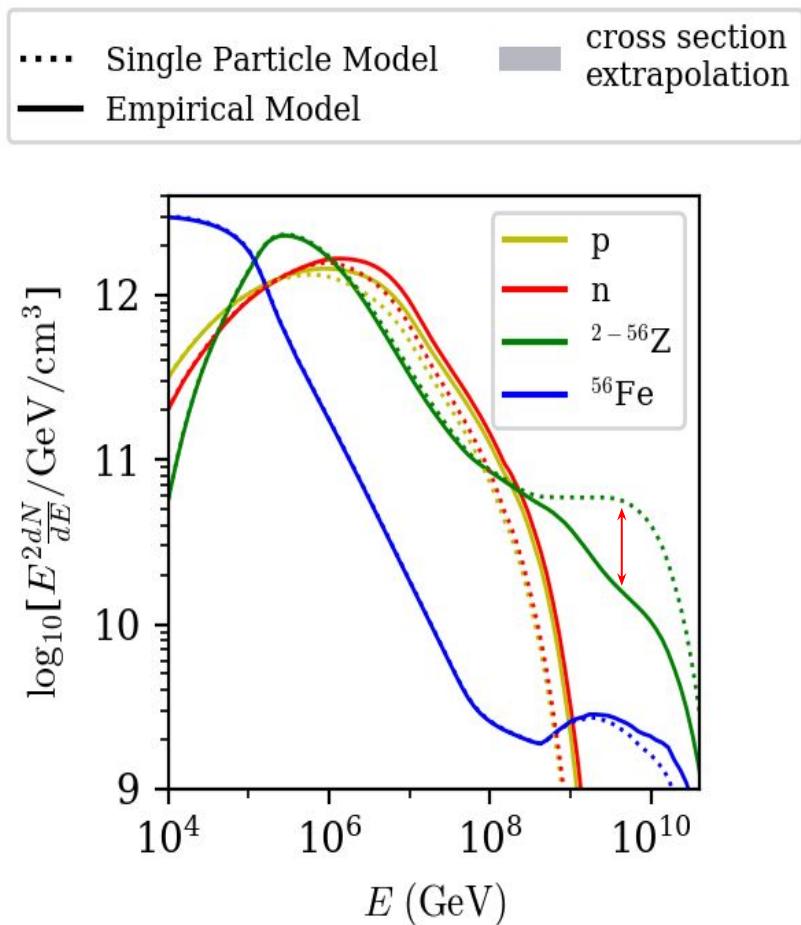

Marked differences in cascade composition!

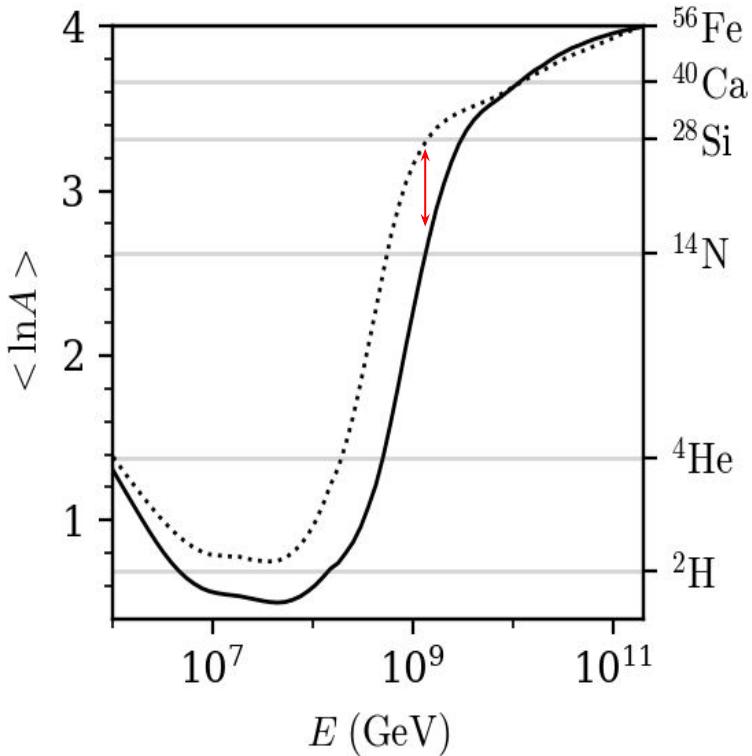

Refs: LM, A. Fedynitch, D. Boncioli, D. Biehl and W. Winter, JCAP 11 (2019) 007
D. Biehl, D. Boncioli, A. Fedynitch and W. Winter, A&A 611, A101 (2018)

Gamma-Ray Burst source

Impact of the nuclear cascade

Marked differences in cascade composition!

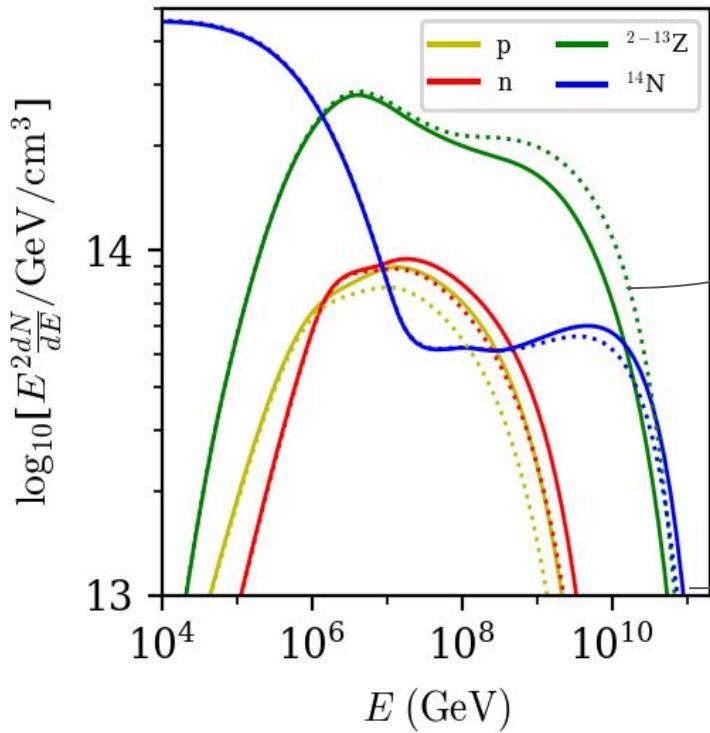

Refs: LM, A. Fedynitch, D. Boncioli, D. Biehl and W. Winter, JCAP 11 (2019) 007
D. Biehl, D. Boncioli, A. Fedynitch and W. Winter, A&A 611, A101 (2018)

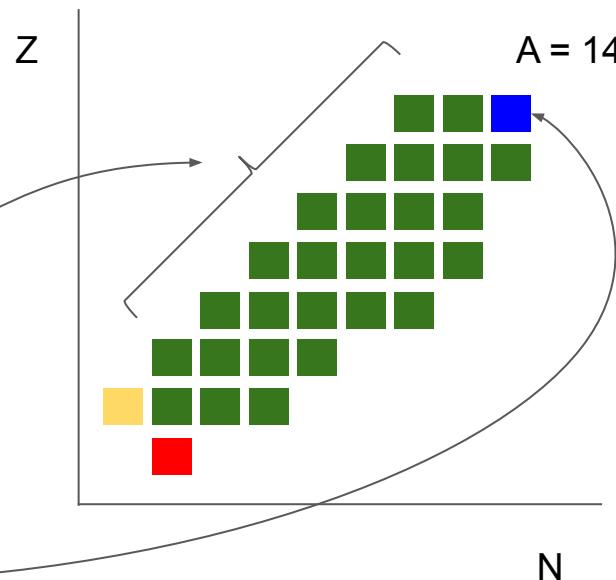

Tidal Disruption Event source

Impact of the nuclear cascade

.... Single Particle Model cross section extrapolation
— Empirical Model

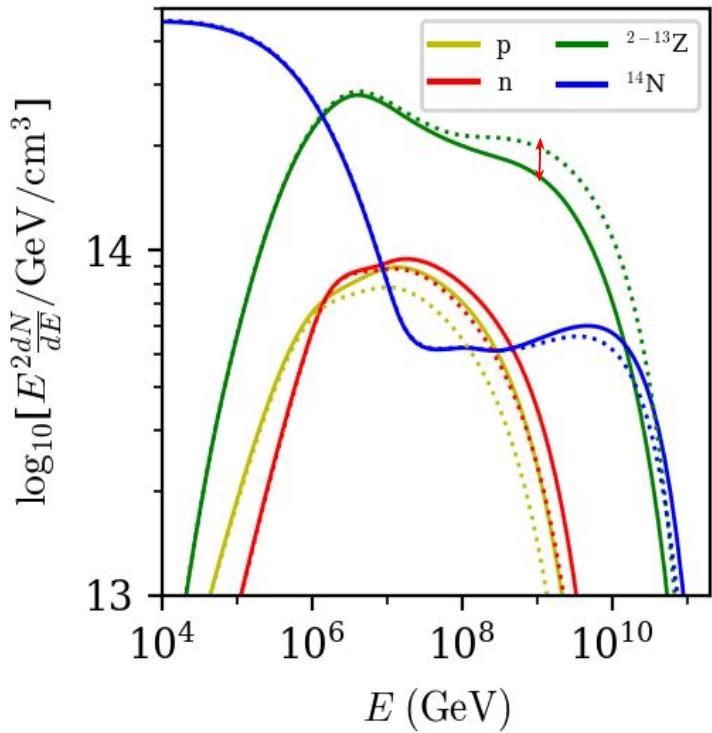

Marked differences in cascade composition!

Tidal Disruption Event source

Impact of the nuclear cascade

Marked differences in cascade composition!

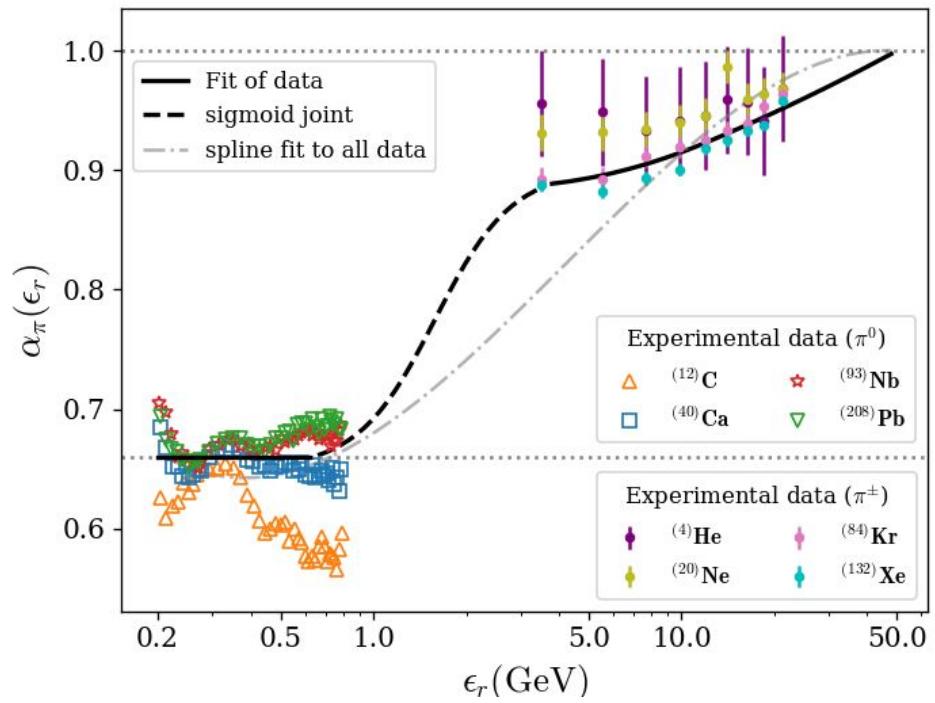

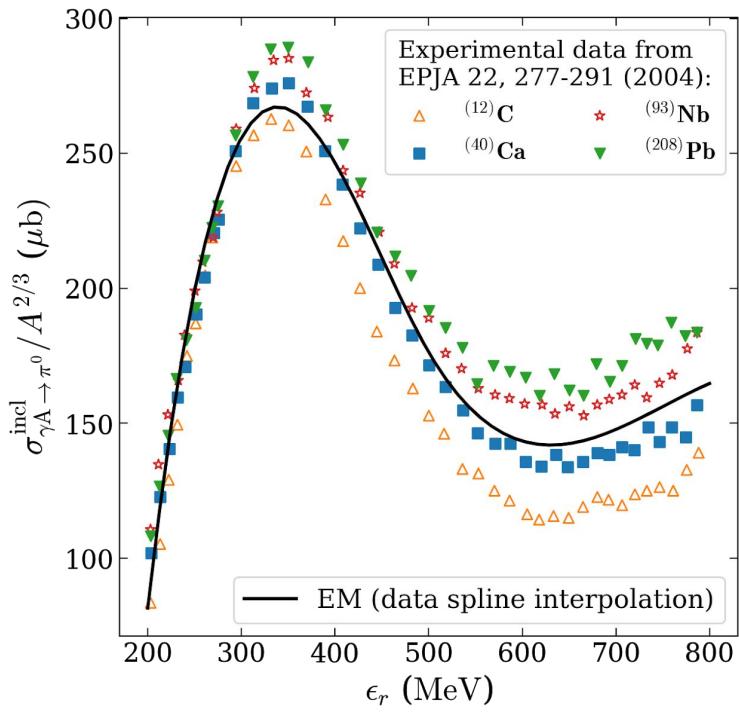

Ref: LM, A. Fedynitch, D. Boncioli, D. Biehl and W. Winter, *JCAP* 11 (2019) 007
D. Buehl, D. Boncioli, C. Lunardini and W. Winter *Sci Rep* 8, 10828 (2018)

Pion production cross section

Impact of the nuclear cascade

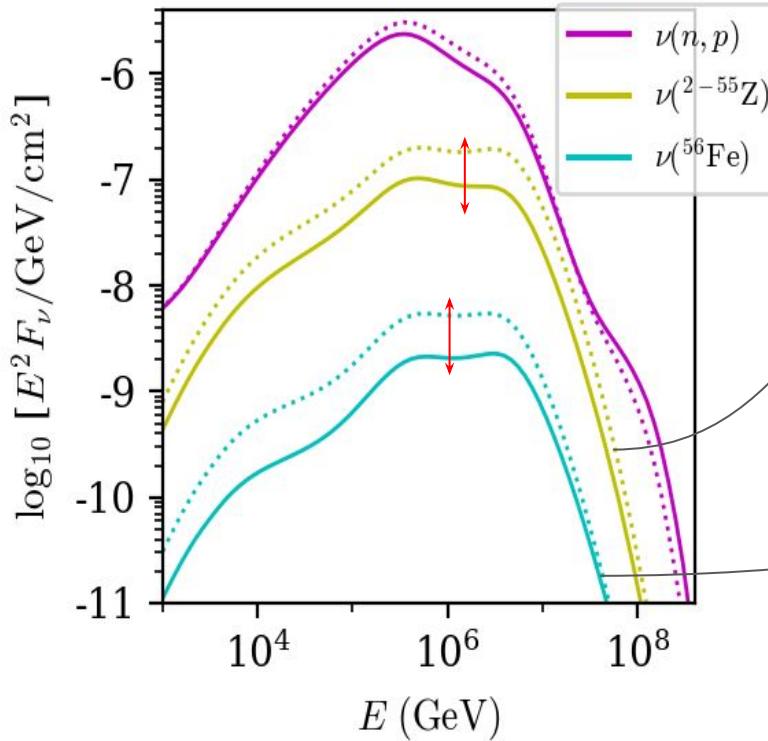

Pion production per nucleon is reduced in nuclei compared to the proton.

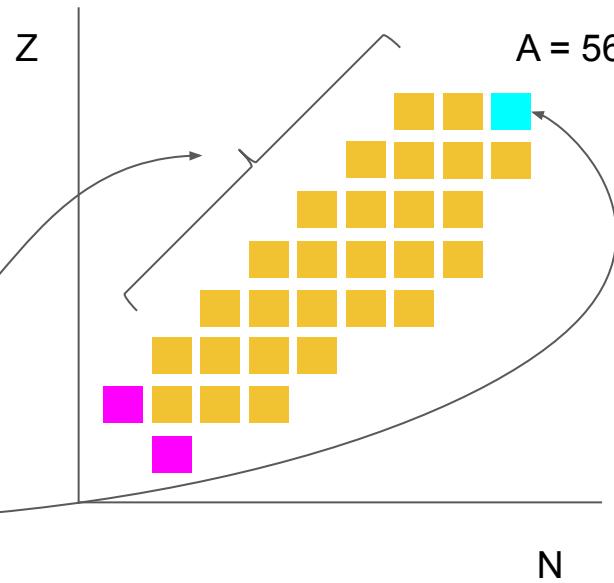

Ref: LM, A. Fedynitch, D. Boncioli, D. Biehl and W. Winter, JCAP11(2019)007

Gamma-Ray Burst source

Impact of the nuclear cascade

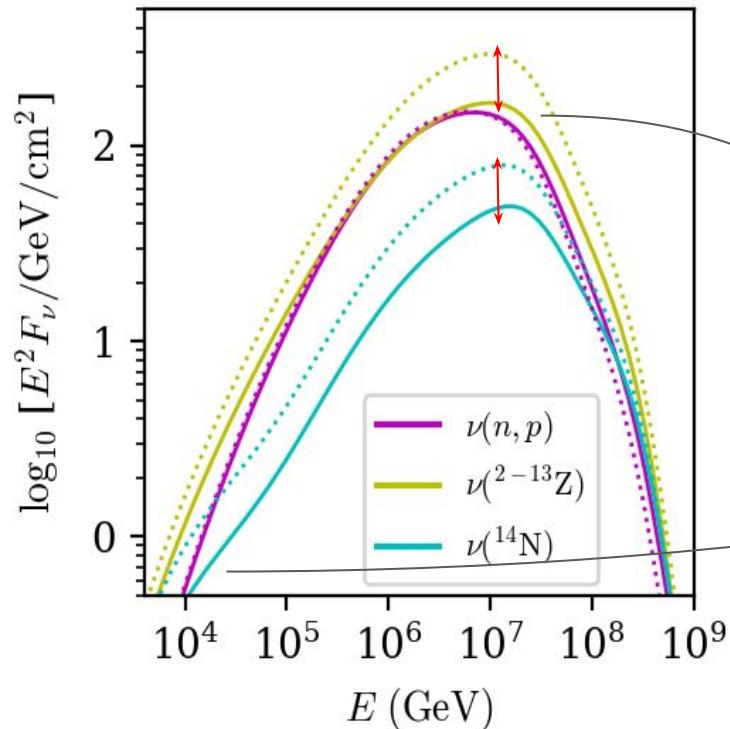

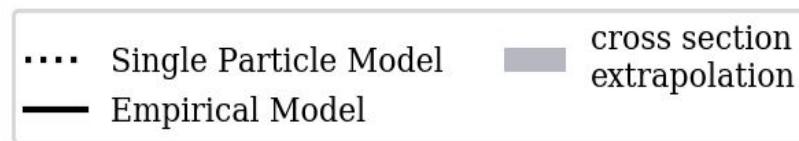

Nuclei contribute less to neutrino flux!

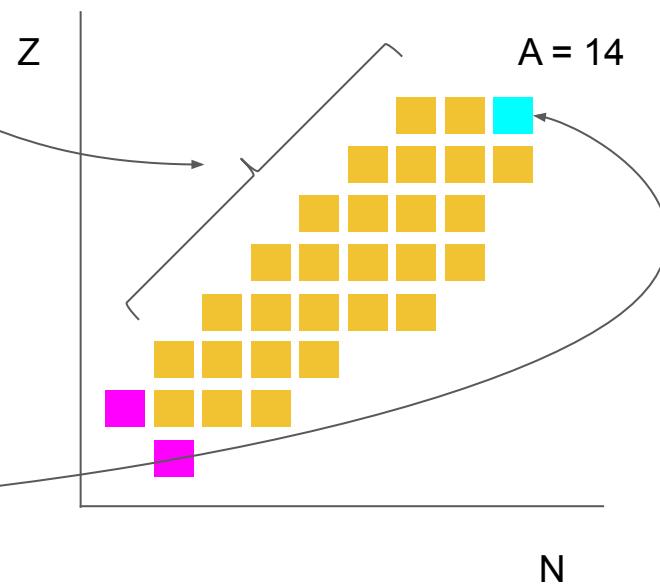

Refs: LM, A. Fedynitch, D. Boncioli, D. Biehl and W. Winter, JCAP 11 (2019) 007
D. Biehl, D. Boncioli, A. Fedynitch and W. Winter, A&A 611, A101 (2018)

Tidal Disruption Event source

Impact of the nuclear cascade

Nuclei contribute less to neutrino flux!

Abstract Photihadronic interactions are important for the sources and the transport of Ultra-High Energy Cosmic Rays (UHECRs). Current state-of-the-art cosmic ray transport simulations handle nuclear disintegration at energies of the Giant Dipole Resonance at a more sophisticated level, as well as the photihadronic interactions of nucleons in the high-energy regime above the pion production threshold. However, the interactions of nuclei above the pion production threshold are commonly modeled by treating the nucleus as a superposition of free nucleons—ignoring the effect of the nuclear medium. We construct an improved, inclusive model for the photomeson regime for nuclei with $A \leq 56$ by employing more accurate, data-driven parametrizations of the interaction cross section, the fragmentation of the primary nucleus and the inclusive pion production cross section

The improved photomeson model

- Available software to compute interaction tables
- Available in PriNCe code (effects study coming)
- Soon to be included in CRPropa interactions

Additional slides

Nuclear breakup: mass distributions

Comparison to data and detailed code

Within order of magnitude without tuning for individual species!

- Within factor ~3 from the data
- Performs similarly as Fluka detailed modelling
- Insensitive to isotopic charge differences

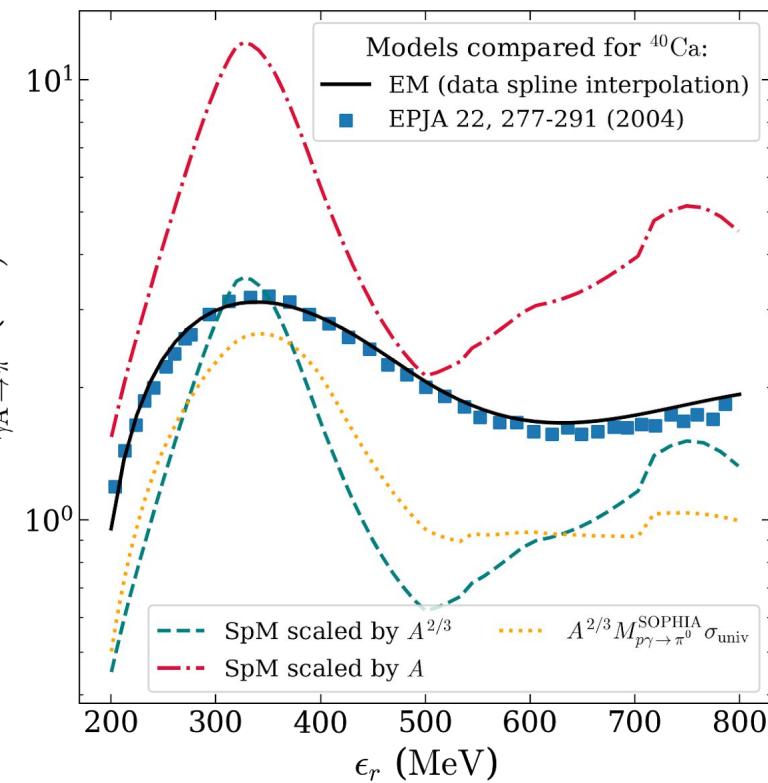

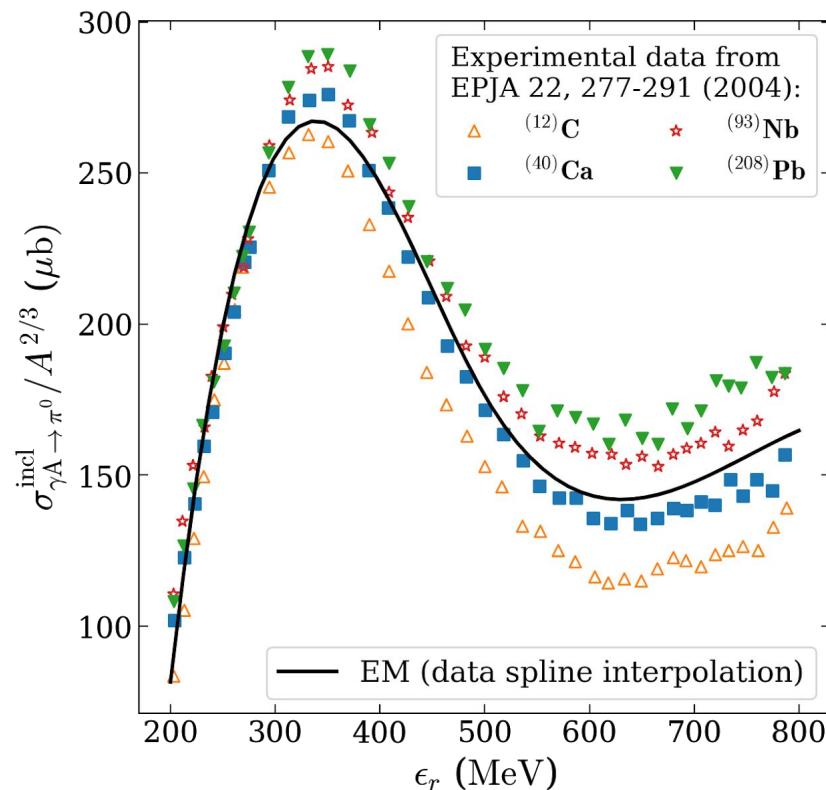

Ref: LM, A. Fedynitch, D. Boncioli, D. Biehl and W. Winter, JCAP11(2019)007

Pion production at threshold

Nuclear medium effects are relevant.

Reabsorption of pions lead to less production. Quasi-free production disfavoured.

Ref: LM, A. Fedynitch, D. Boncioli, D. Biehl and W. Winter, JCAP11(2019)007
