Weyl Fermions on a Finite Lattice

Monday 19 August 2024 15:00 (30 minutes)

The phenomenon of unpaired Weyl fermions appearing on the sole $2\mathbb{Z}$ -dimensional boundary of a $(2\mathbb{Z}+1)$ -dimensional manifold with massive Dirac fermions was recently analyzed. I discuss how similar unpaired Weyl edge states can be seen on a finite lattice. In particular, I consider the discretized Hamiltonian for a Wilson fermion in $(2+1)$ dimensions with a $1+1$ dimensional boundary and continuous time. The low lying boundary spectrum is indeed Weyl-like: it has a linear dispersion relation and definite chirality and circulates in only one direction around the boundary. This results is consistent with Nielsen-Ninomiya theorem and removes one potential obstacle facing the program of regulating chiral gauge theories.
