*How does QCD generate this? The role of quarks and of gluons?*

# How does QCD generates most of the nucleon mass? Breaking of scale Invariance

See for example, M. E. Peskin and D. V. Schroeder, An Introduction to quantum field theory, Addison-Wesley, Reading (1995), p. 682

- ◇ Trace of the QCD energy-momentum tensor: D. Kharzeev Proc. Int. Sch. Phys. Fermi 130 (1996)

$$T_\alpha^\alpha = \underbrace{\frac{\beta(g)}{2g} G^{\alpha\beta a} G_{\alpha\beta}^a}_{\text{QCD trace anomaly}} + \sum_{l=u,d,s} m_l (1 + \gamma_{m_l}) \bar{q}_l q_l + \sum_{c,b,t} m_h (1 + \gamma_{m_h}) \bar{Q}_l Q_l$$

with  $\beta(g) = -b \frac{g^3}{16\pi^2} + \dots$ ,  $b = 9 - \frac{2}{3} n_h$   
 Gross, Wilczek & Politzer

At small momentum transfer, heavy quarks decouple:

M. Shifman et al., Phys. Lett. 78B (1978)

$$\sum_h \bar{Q}_h Q_h \rightarrow -\frac{2}{3} n_h \frac{g^2}{32\pi^2} G^{\alpha\beta a} G_{\alpha\beta}^a + \dots$$

$$T_\alpha^\alpha = \frac{\tilde{\beta}(g)}{2g} G^{\alpha\beta a} G_{\alpha\beta}^a + \sum_{l=u,d,s} m_l (1 + \gamma_{m_l}) \bar{q}_l q_l$$

- ◇ Trace anomaly, chiral symmetry breaking, ...

$$M^2 \propto \langle P | T_\alpha^\alpha | P \rangle \xrightarrow[\text{Chiral limit}]{} \frac{\tilde{\beta}(g)}{2g} \langle P | G^2 | P \rangle$$

In the chiral limit we have a finite number for the nucleon ( $\sim 800$  MeV) and zero for the pion

# HIGGS MASS CONTRIBUTION TO THE PROTON

Pion-Nucleon Sigma Term

$$\sigma_{\pi N} = \langle N(P) | m_u \bar{u}u + m_d \bar{d}d | N(P) \rangle = (59.1 \pm 3.5) \text{ MeV}$$

Strangeness content

$$\sigma_s = \langle N(P) | m_u \bar{s}s | N(P) \rangle = 41.0(8.4) \text{ MeV}$$

A talk by Ulf-G Meißner at the 3<sup>rd</sup> Proton Mass Workshop, Jan 14-2021

<https://indico.phy.anl.gov/event/2/>

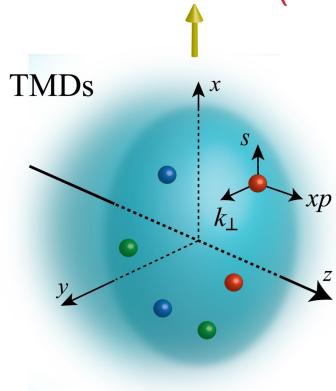

Consequence for the proton mass: About 100 MeV from the Higgs, the rest is gluon field energy

# ELASTIC ELECTRON SCATTERING & ELECTROMAGNETIC FORM FACTORS

- Elastic  $e^- p \rightarrow e^- p$  scattering used for more than **60 years** to investigate nucleon structure
- In 1-photon exchange approximation:  
nucleon structure parameterized by two form factors

$$\begin{aligned} A_{\lambda\lambda'}^{\mu} &= \langle p + \frac{1}{2}q, \lambda' | J^{\mu}(0) | p - \frac{1}{2}q, \lambda \rangle \\ &= \bar{u}(p + \frac{1}{2}q, \lambda') \left[ F_1(Q^2) \gamma^{\mu} + F_2(Q^2) \frac{i}{2m} \sigma^{\mu\nu} q_{\nu} \right] u(p - \frac{1}{2}q, \lambda) \end{aligned}$$

Dirac              Pauli

$F_1$  helicity conserving,     $F_2$  helicity flip form factors

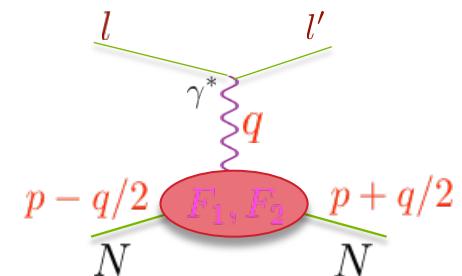

- In experiments we measure the Sachs form factors

$$\frac{d\sigma}{d\Omega}(E, \theta) = \sigma_M \left[ \frac{G_E^2 + \tau G_M^2}{1 + \tau} + 2\tau G_M^2 \tan^2\left(\frac{\theta}{2}\right) \right]$$

Rosenbluth Formula

$$\sigma_M = \frac{\alpha^2 E' \cos^2\left(\frac{\theta}{2}\right)}{4E^3 \sin^4\left(\frac{\theta}{2}\right)}$$

$$\tau = \frac{Q^2}{2M}$$

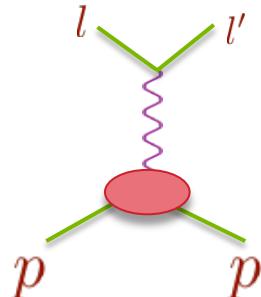

$$\begin{aligned} G_E(Q^2) &= F_1(Q^2) - \tau F_2(Q^2) \\ G_M(Q^2) &= F_1(Q^2) + F_2(Q^2) \end{aligned}$$

# EXPERIMENTAL REACTIONS TO DETERMINE FORM FACTORS

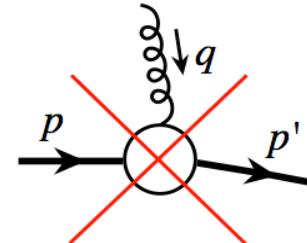

## Proton electric charge distribution

Elastic Scattering

## Proton color charge distribution?

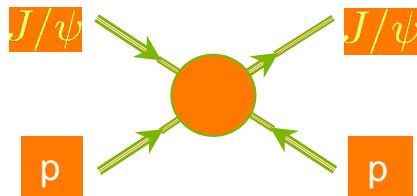

Elastic color scattering; **but forbidden**

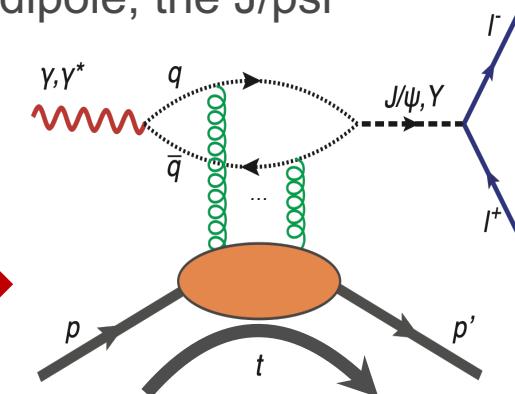

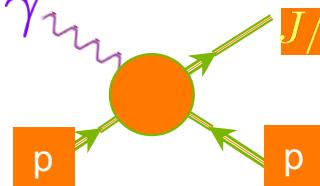

What to do to probe the gluon density?

Perhaps replace the proton by a color dipole, the J/psi

Elastic J/psi scattering

Photoproduction of J/psi

# GRAVITATIONAL FORM FACTORS (GFFS)

## Towards observables of the matter structure of the proton

GFFs are matrix elements of the QCD energy-momentum tensor (EMT) for quarks and gluons

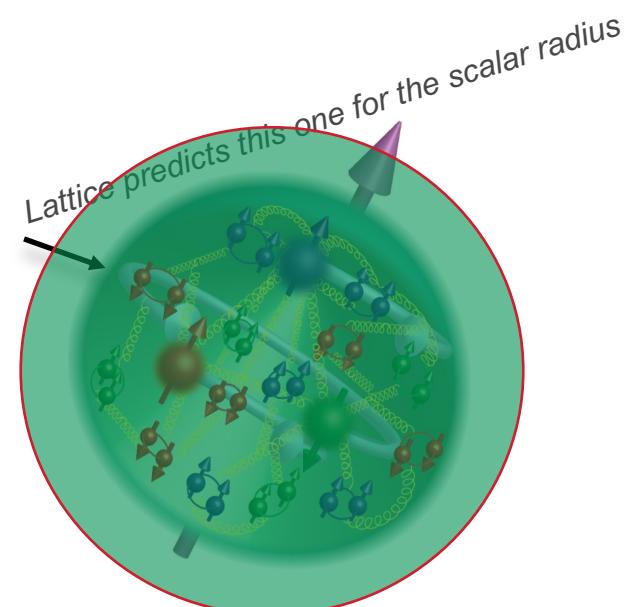

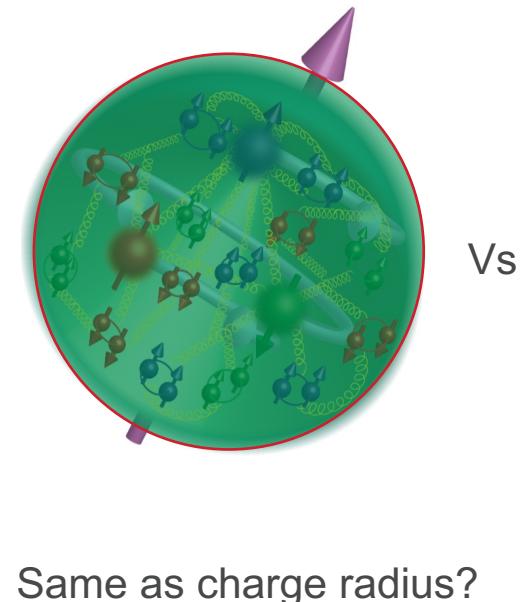

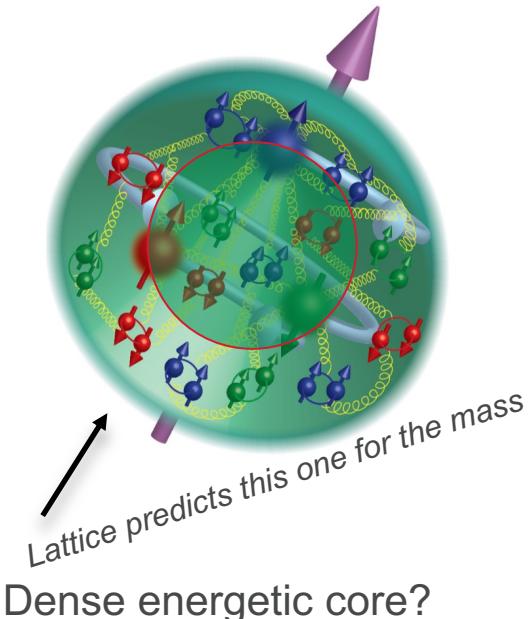

$$\begin{aligned} & \langle N' | T_{q,g}^{\mu,\nu} | N \rangle \\ &= \bar{u}(N') \left( A_{g,q}(t) \gamma^{\{\mu} P^{\nu\}} + B_{g,q}(t) \frac{i P^{\{\mu} \sigma^{\nu\}} \rho \Delta_\rho}{2M} + C_{g,q}(t) \frac{\Delta^\mu \Delta^\nu - g^{\mu\nu} \Delta^2}{M} + \bar{C}_{g,q}(t) M g^{\mu\nu} \right) u(N) \end{aligned}$$

EMT physics (mass, spin, pressure, shear forces) is encoded in these GFFs:

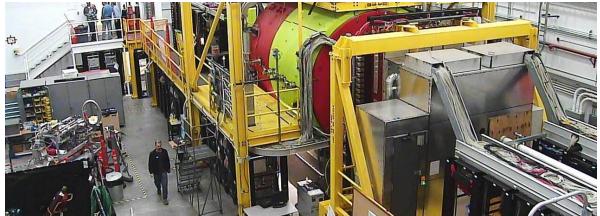

- $A_{g,q}(t)$ : Related to quark and gluon momenta,  $A_{g,q}(0) = \langle x_{q,g} \rangle$
- $J_{g,q}(t) = 1/2(A_{g,q}(t) + B_{g,q}(t))$ : Related to angular momentum,  $J_{tot}(0) = 1/2$
- $D_{g,q}(t) = 4C_{g,q}(t)$ : Related to pressure and shear forces

# HOW IS THE GLUON ENERGY INSIDE THE PROTON?

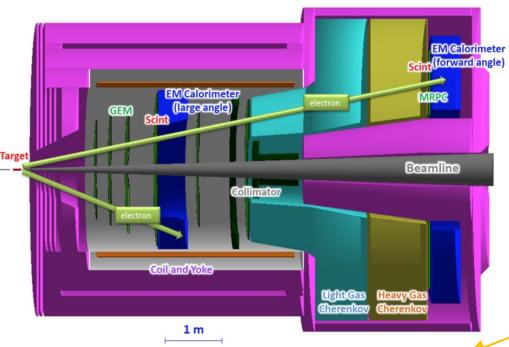

- How is it split between gravitons-like gluons config. and scalar field config.
- How does the mass radius compare to the charge radius?
- How about the scalar energy radius?

# 12 GEV J/Ψ EXPERIMENTS AT JEFFERSON LAB NOW AND FUTURE

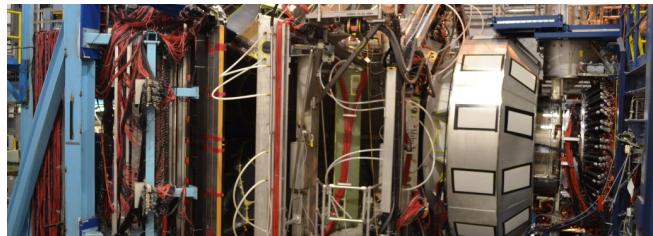

Hall D - GlueX observer the first J/ψ at JLab  
A. Ali et al., PRL 123, 072001 (2019)

Hall A has experiment E12-12-006 at **SoLID** to measure J/ψ in electro- and photoproduction, and an LOI to measure double polarization using **SBS**

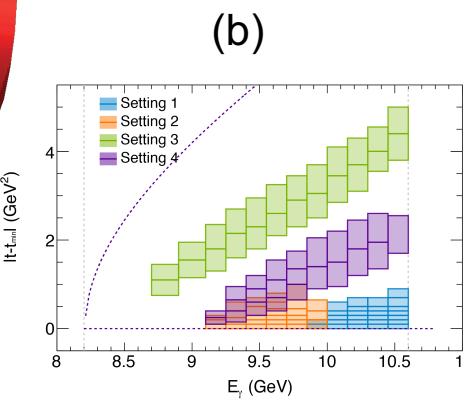

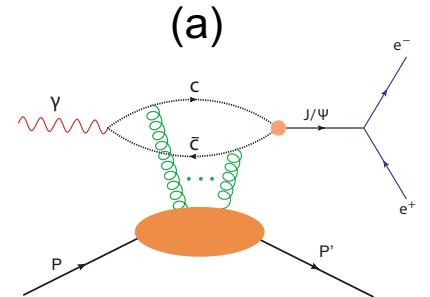

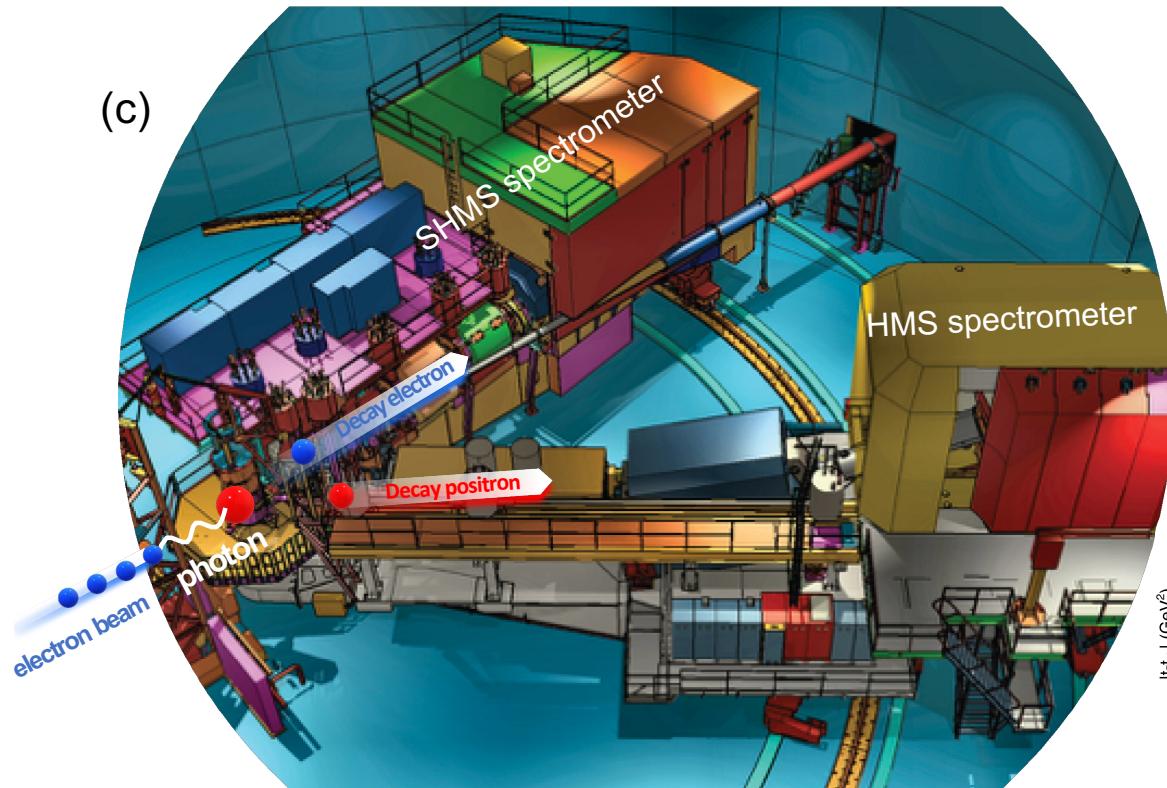

Hall C has the **J/ψ-007** experiment (E12-16-007)  
LHCb hidden-charm pentaquark search

Hall B - **CLAS12** has experiments to measure TCS +  
J/ψ in photoproduction as part of Run Groups A  
(hydrogen) and B (deuterium): E12-12-001, E12-12-  
001A, E12-11-003B

# JLAB EXPERIMENT E12-16-007 IN HALL C AT JLAB

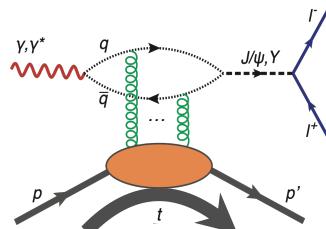

## Near threshold photoproduction of $\text{J}/\psi$

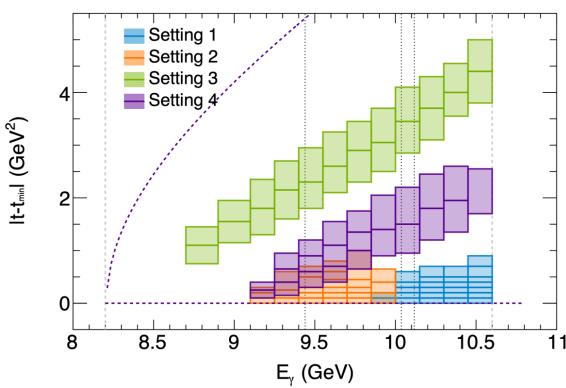

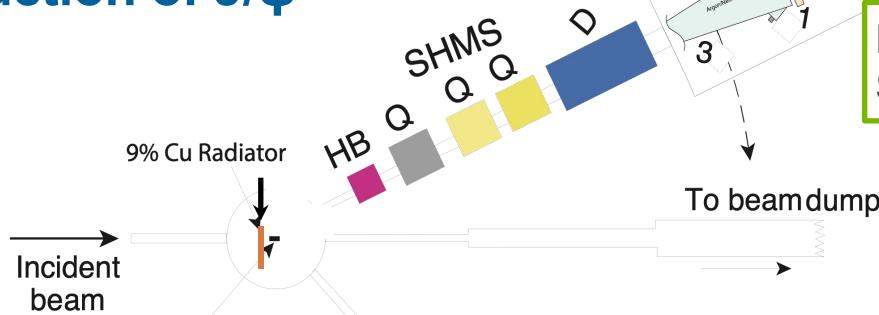

# JLAB EXPERIMENT E12-16-007

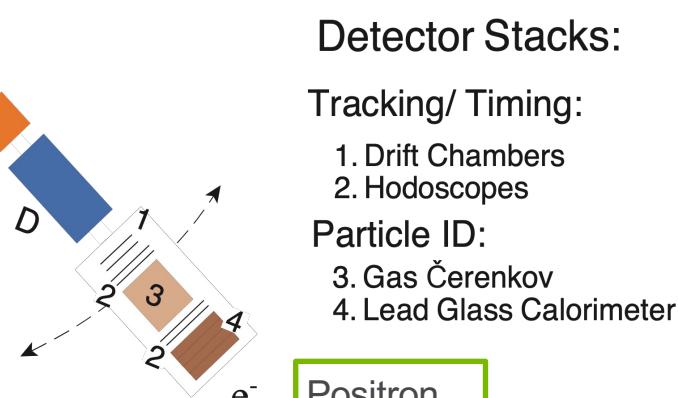

## Near threshold photoproduction of $J/\psi$

**$J/\psi$  threshold:**  
 $W \approx 4.04\text{GeV}$   
 $E_\gamma^\text{lab} \approx 8.2\text{GeV}$   
 $t \approx -1.5\text{GeV}^2$

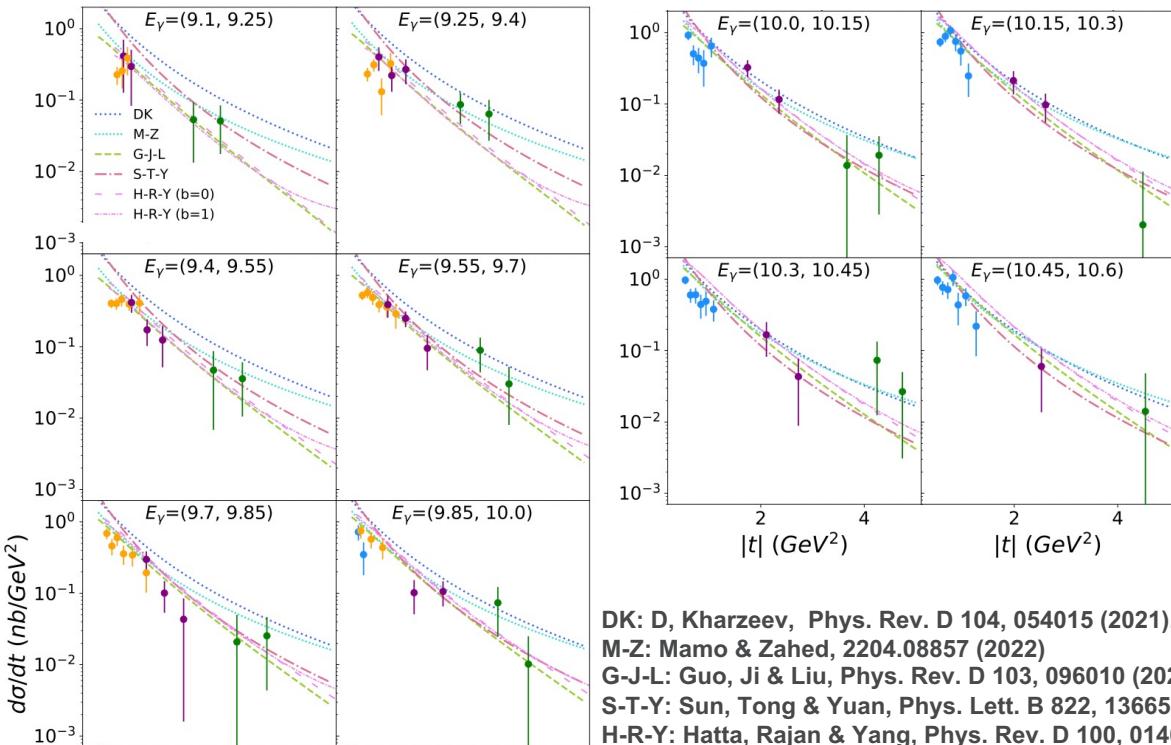

- Ran February 2019 for  $\sim 8$  PAC days
- High intensity real photon beam (50 $\mu\text{A}$  electron beam on a 9% copper radiator)
- 10cm liquid hydrogen target
- Detect  $J/\psi$  decay leptons in coincidence
- Bremsstrahlung photon energy fully constrained

## led channels and pentaquarks

- The previous considerations rely on the application of Vector Meson Dominance.
- Thus the contribution from open-charm meson channels and potential pentaquark must be understood or ruled-out.

→ Total cross-section as a function of photon energy

# CAVEATS IN THE GFFS EXTRACTION

There are certainly caveats in the extraction of the GFFs using models but this first attempt points to a promising future

## Holographic Model

- The method is suitable for threshold production, a.k.a **non-perturbative region**.
- No vector dominance model has been used
- The model seems to **track the lattice results**
- Our extraction presumes no pentaquark resonances or threshold effects in this region of cross section data
- $B_g(t)$  is neglected in the cross section expression, consistent with its smallness in lattice QCD and the holographic model
- We have neglected  $C(t)_g$ , in the cross section expression or radii.  $C_g(0)=-C_q(0)$  and calculated in:

Hatta *et al.* JHEP 12 (2018) 008, & Tanaka, K. JHEP 03 (2023) 013

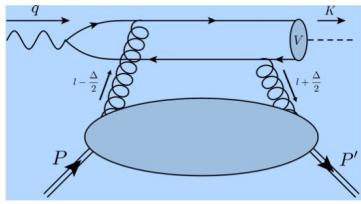

## GPD Model

- Unlike in the case of large photon-nucleon center of mass energy here  $t$  is large.
- **Two gluons** exchange is clearly not sufficient and higher order will need to be evaluated
- The GPD Model is expected to be adequate the large skewdness region
- $B_g(t)$  is neglected in the cross section expression, consistent with its smallness in lattice QCD and the holographic model
- We have neglected  $\bar{C}(t)_g$ , in the cross section expression or radii

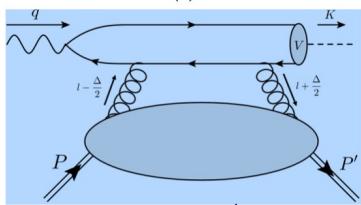

# THE GENERALIZED PARTON DISTRIBUTION MODEL

2D fit to extract  $A(t)$  &  $C(t)$  assuming  $B(t)$  negligible

Y. Guo, X. Ji and Y. Liu, Phys. Rev. D **103**, no.9, 096010 (2021) and Y. Guo, X. Ji and Y. Liu, J. Yang, Phys. Rev. D **108** (2023) no.3, 034003

$$\frac{d\sigma}{dt} = \frac{\alpha_e m e_Q^2}{4(W^2 - m_N^2)^2} \frac{(16\pi\alpha_s)^2}{3M_V^2} |\psi_{NR}|^2 |G(t, \xi)|^2$$

$$G(t, \xi) = \sum_0^{\infty} \frac{1}{\xi^{2n+2}} \int_{-1}^1 dx x^{2n} F_g(x, \xi, t)$$

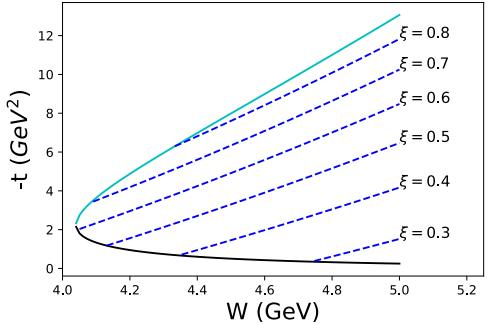

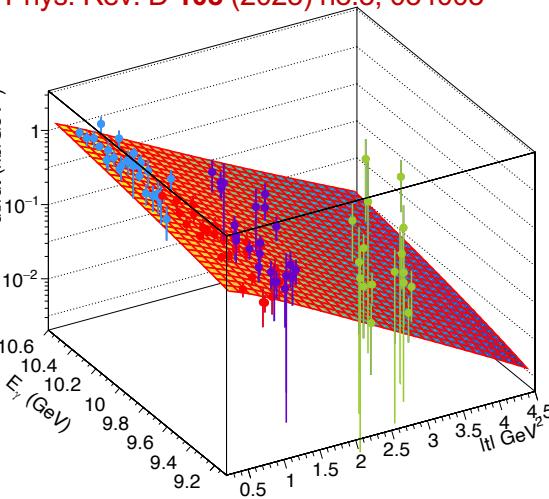

$$|G(t, \xi)|^2 = \frac{4}{\xi^4} \left\{ \left(1 - \frac{t}{4m_N^2}\right) E_2^2 - 2E_2(H_2 + E_2) + (1 - \xi^2)(H_2 + E_2)^2 \right\}$$

$$\int_0^1 dx H_g(x, \xi, t) = A_{2,0}^g(t) + (2\xi)^2 C_2^g \equiv H_2(t, \xi)$$

$$\int_0^1 dx E_g(x, \xi, t) = B_{2,0}^g(t) - (2\xi)^2 C_2^g \equiv E_2(t, \xi)$$

$$A_g(t) = \frac{A_g(0)}{\left(1 - \frac{t}{m_A^2}\right)^3}$$

$$C_g(t) = \frac{C_g(0)}{\left(1 - \frac{t}{m_C^2}\right)^3}$$

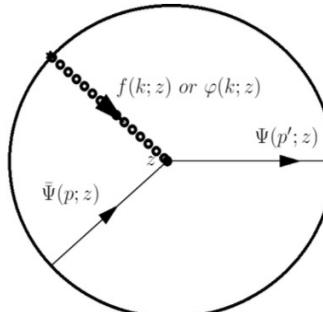

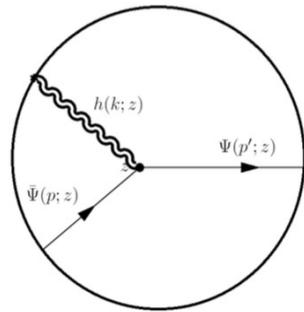

# THE HOLOGRAPHIC QCD MODEL

2D fit to extract the  $A(t)$  &  $C(t)$  assuming  $B(t)$  to be small

M-Z: K. Mamo & I. Zahed, PRD 103, 094010 (2021) and 2204.08857 (2022)

A tensor component and a scalar component

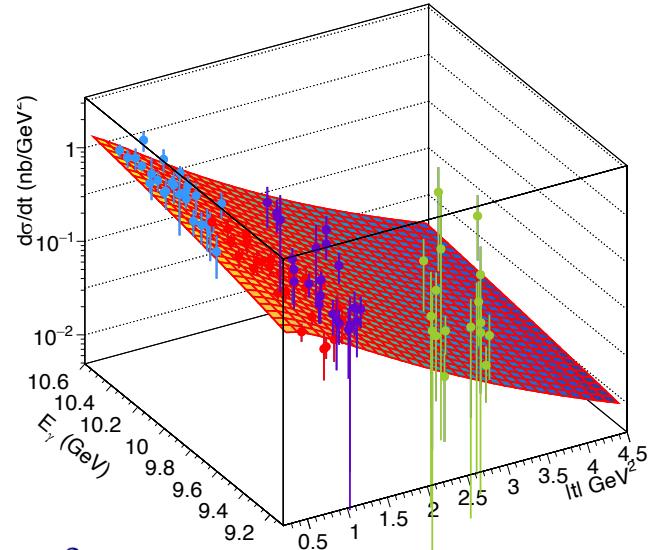

Spin-2 :  $\langle p_2 | T^{xy}(0) | p_1 \rangle$

Spin-0 :  $\langle p_2 | T_\mu^\mu(0) | p_1 \rangle$

$$\frac{d\sigma}{dt} = \mathcal{N} \times \frac{e^2}{64\pi(s - m_N^2)^2} \times \frac{[A(-t, \kappa_T) + \eta^2 D(-t, \kappa_T, \kappa_S)]^2}{A^2(0)} \times F(\tilde{s}) \times 8$$

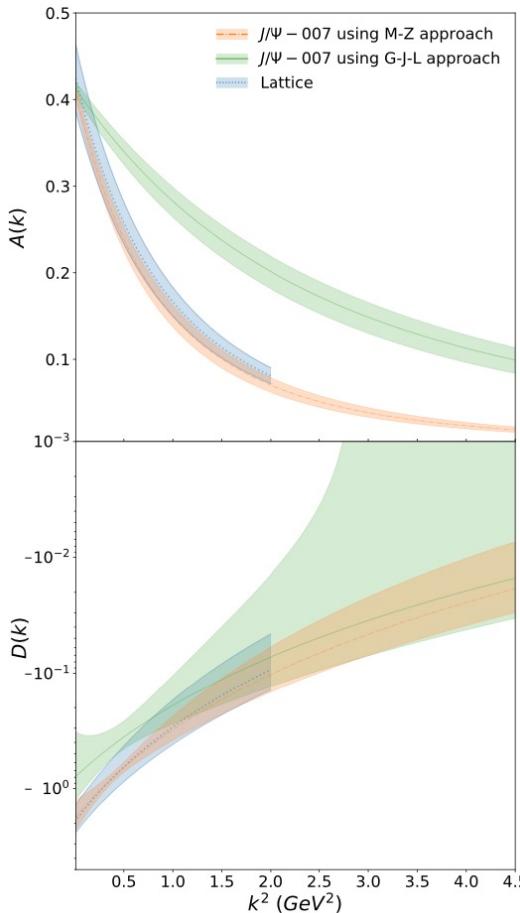

- $A(t)$  and  $D(t)$  shapes are fully calculated; However, dipole forms are assumed as very good approximations and are used in the fits to the data.  $A_g(0) = \langle x_g \rangle$  is fixed to the DIS value from global fit CT18.
- $B(t)$  is neglected and  $\mathcal{N}$  is normalized to the cross section.

# GLUONIC GFF RESULTS; FIRST EXTRACTION

007<sup>J/ψ</sup>

## Good agreement between holographic QCD extraction and lattice results!

- Results from the 2D gluonic GFF fits
- Gluonic  $A_g(t)$  and  $D_g(t) = 4C_g(t)$  form factors
- $\chi^2/n.d.f.$  in both cases is very close to 1
- M-Z (holographic QCD) approach fit to only experimental data gives results very close to the latest [lattice](#) results!
- GPD approach gives very different values, may indicate (expected) issues with the factorization assumption but

**M-Z:** K. Mamo & I. Zahed, PRD 103, 094010 (2021) and 2204.08857 (2022)

**G-J-L:** Y. Guo, X. Ji & Y. Liu PRD 103, 096010(2021)

**Lattice:** D. Pefkou, D. Hackett, P. Shanahan, Phys. Rev. D 105, 054509 (2022).

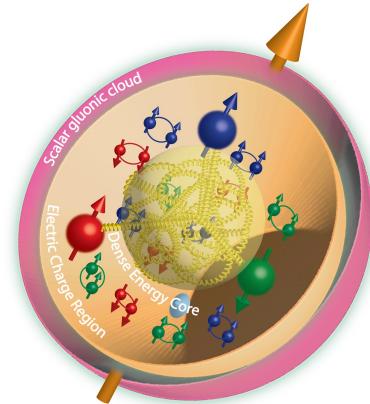

# FIRST EXTRACTION OF GLUONIC SCALAR/MASS RADIUS OF THE NUCLEON

A picture of three zones?

## Definition of gluonic mass and scalar radius

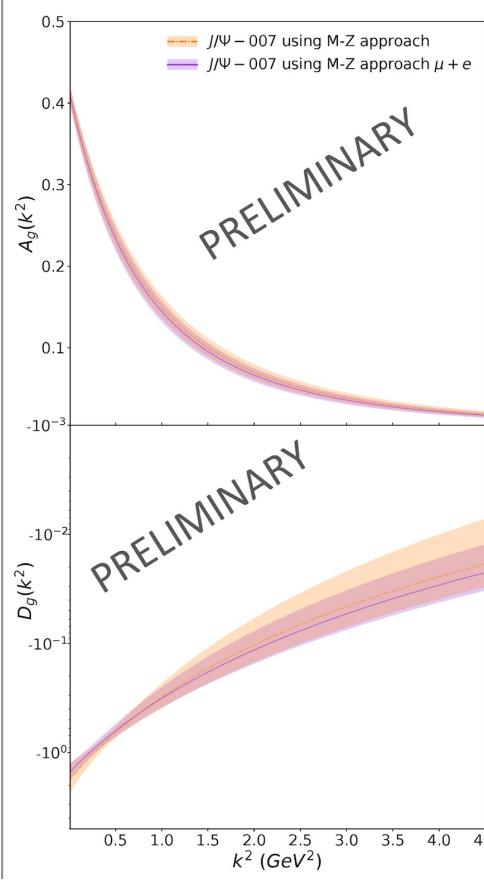

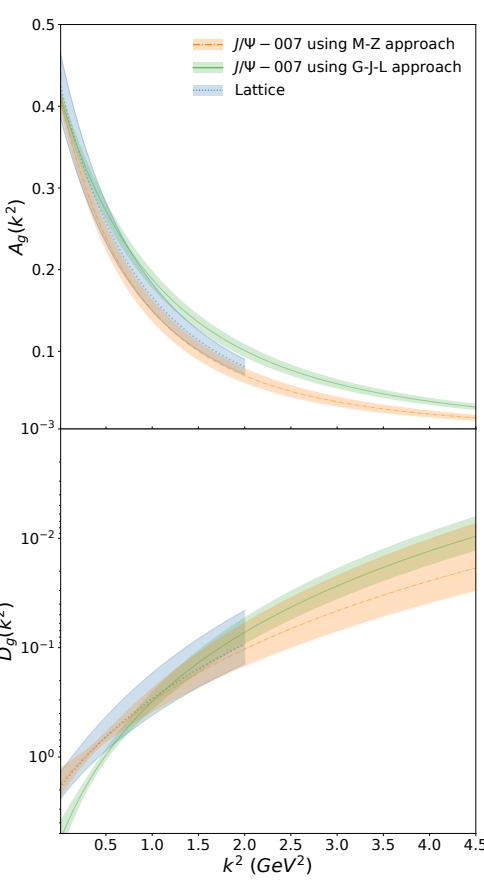

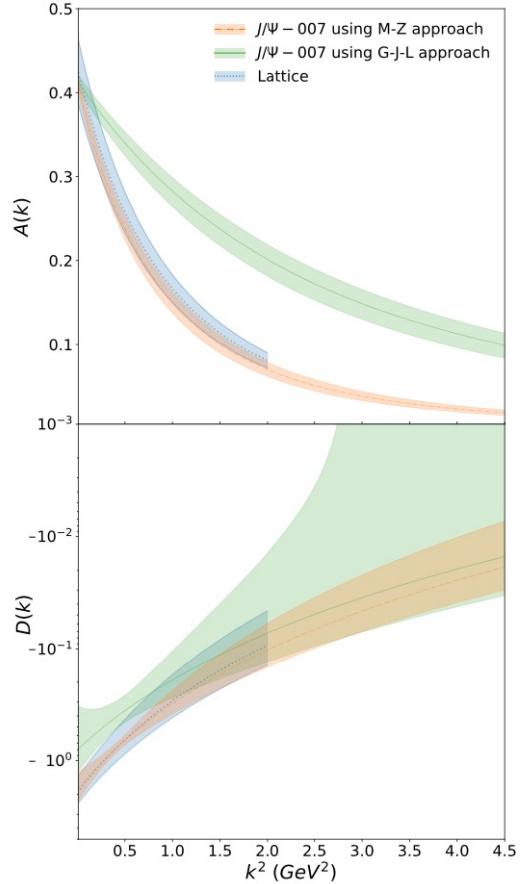

$$\langle r_m^2 \rangle_g = 6 \frac{1}{A_g(0)} \frac{dA_g(t)}{dt} \Big|_{t=0} - 6 \frac{1}{A_g(0)} \frac{C_g(0)}{M_N^2}$$

$$\langle r_s^2 \rangle_g = 6 \frac{1}{A_g(0)} \frac{dA_g(t)}{dt} \Big|_{t=0} - 18 \frac{1}{A_g(0)} \frac{C_g(0)}{M_N^2}$$

Theoretical approach GFF functional form	$\chi^2/\text{n.d.f}$	$m_A$ (GeV)	$m_C$ (GeV)	$C_g(0)$	$\sqrt{\langle r_m^2 \rangle_g}$ (fm)	$\sqrt{\langle r_s^2 \rangle_g}$ (fm)
Holographic QCD Tripole-tripole	0.925	$1.575 \pm 0.059$	$1.12 \pm 0.21$	$-0.45 \pm 0.132$	$0.755 \pm 0.067$	$1.069 \pm 0.126$
GPD Tripole-tripole	0.924	$2.71 \pm 0.19$	$1.28 \pm 0.50$	$-0.20 \pm 0.11$	$0.472 \pm 0.085$	$0.695 \pm 0.162$
Lattice Tripole-tripole		$1.641 \pm 0.043$	$1.07 \pm 0.12$	$-0.483 \pm 0.133$	$0.7464 \pm 0.055$	$1.073 \pm 0.114$

# COMPLEMENTARITY WITH EIC

## Upsilon production and J/ψ production at large $Q^2$

- $\Upsilon(1S)$  at EIC trades statistical precision of  $J/\psi$  at SoLID for lower theoretical uncertainties, and extra channel to study universality.
- Large  $Q^2$  reach at EIC an additional knob to study production, near-threshold  $J/\psi$  production at large  $Q^2$  may be experimentally feasible!

# CONCLUSION

- We are at the dawn of an exciting avenue of nucleon's gluonic structure research through the determination of the gGFFs of the nucleon.
- Precision data in electroproduction and photoproduction of quarkonium near threshold provide critical information on
  - ✓ **The origin of hadron masses through the gravitational form factors**
  - ✓ **The gluon contribution to the mass density, the scalar density, the pressure and shear**
- Consistent with early lattice predictions we have **a sneak preview of the gluonic density distribution in the proton from data with the help of models**
- Statistical precision will enable an understanding of the systematic uncertainties in the extractions of the anomaly, the mass radius and the scalar radius, the pressure and shear
- In addition to photo-production measurements ePIC at EIC and SoLID at JLab will provide near threshold  $J/\psi$  (JLab at low  $Q^2$ , EIC at high  $Q^2$ ) electroproduction measurements and Upsilon (EIC) precision measurements, critical **for universality and the trace anomaly**

D. Kharzeev, H. Satz, A. Syamtomov, and G. Zinovjev, Eur.Phys.J., C9:459–462, 1999

Photoproduction cross section at  $t=0$  linked to the forward elastic scattering amplitude of  $J/\psi$ -N through VMD

$$\left| F_{J/\Psi N} \right| = \left[ 64\pi [m_{J/\psi}^2(\lambda^2 - m_N^2)] \frac{d\sigma_{J/\psi N \rightarrow J/\psi N}}{dt} \Big|_{t=0} \right]^{1/2}$$

$$\lambda = (p_N p_{J/\psi} / m_{J/\psi}) \quad \text{Nucleon energy in the charmonium rest frame}$$

$$\left| F_{J/\Psi N} \right| \simeq r_0^3 d_2 \frac{2\pi^2}{27} 2M_N^2 (1-b) = r_0^3 d_2 \frac{16\pi^2}{27} M_N M_a$$

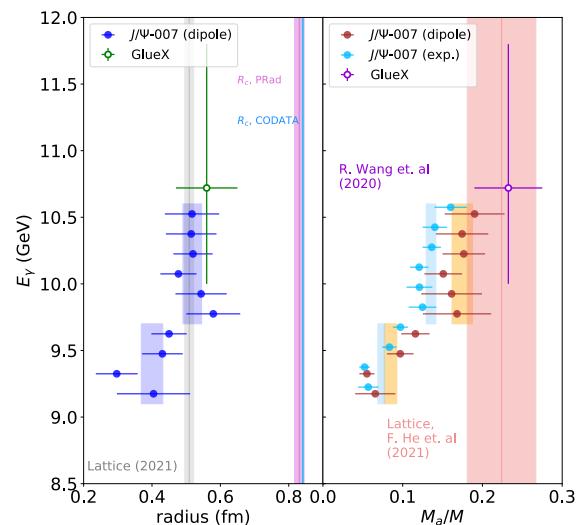

$$r_0 = \left( \frac{4}{3\alpha_s(\mu^2)} \right) \frac{1}{m_c(\mu^2)}$$

Bohr radius of charmonium

$$d_2^{(1S)} = \left( \frac{32}{N_c} \right)^2 \sqrt{\pi} \frac{\Gamma(n+5/2)}{\Gamma(n+5)}$$

Wilson coefficient

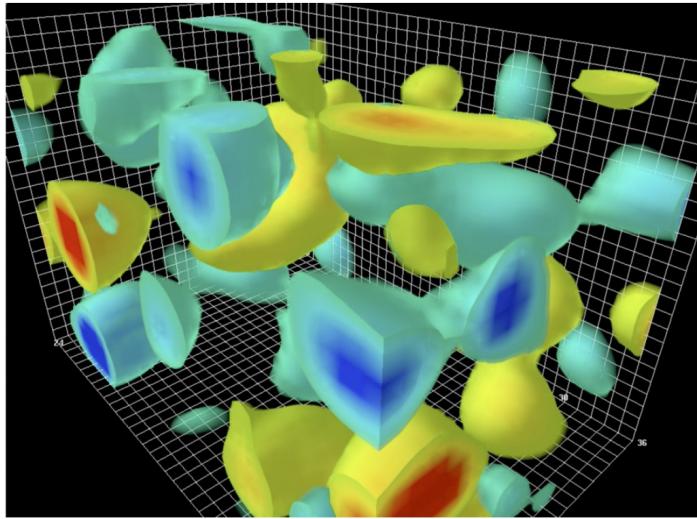

$$\text{Rydberg energy squared} = \mu^2$$

# A HOLOGRAPHIC APPROACH

- Holography provides a string-based approach dual to Yang-Mills (YM)

Instantons (yellow) and anti-instantons (blue)

Leinweber et al. 2003

Cooled Yang Mills vacuum filled with topological gauge fields

Vacuum; a liquid on Instantons

Gluon condensate in the nucleon is linked to the QCD vacuum compressibility which measures the diluteness of the QCD instanton vacuum as a topological liquid.

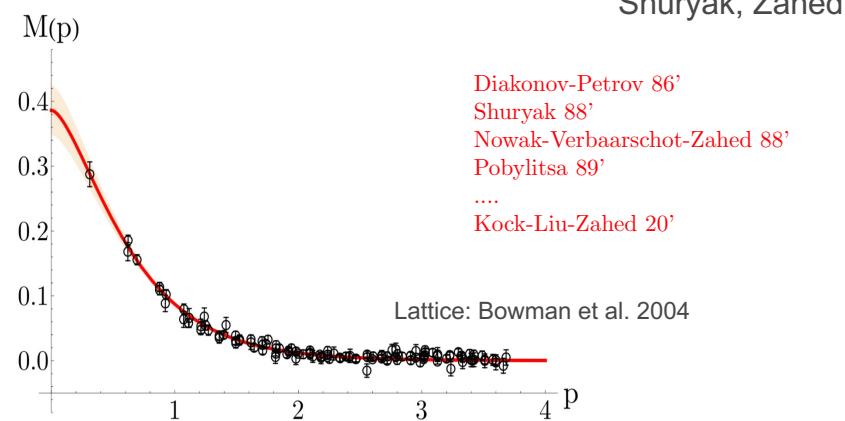

FIG. 2: Momentum dependence of the instanton induced effective quark mass in singular gauge (13) at LO (solid-curves), compared to the effective quark mass measured on the lattice in Coulomb gauge [21] (open-circles). The unit scale is GeV. We obtain a fitted parameter intervals  $M(0) = 383 \pm 39$  MeV and  $\rho = 0.313 \pm 0.016$  fm.

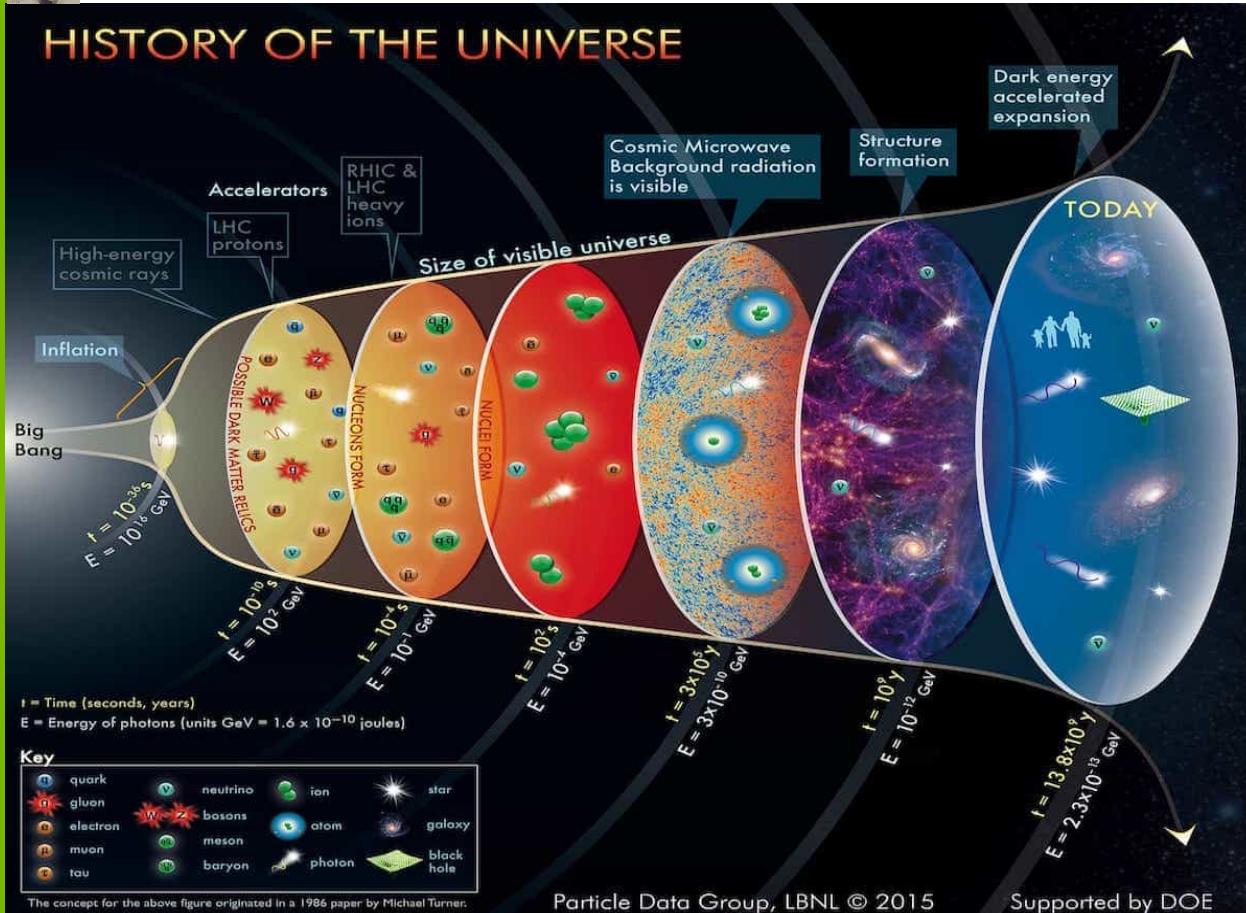

- Topological origin of mass

- Vacuum conformal symmetry breaking by density of instantons and the rate of vacuum tunneling
- Spontaneous chiral symmetry breaking follows simultaneously from the delocalization of the light quarks zero modes!

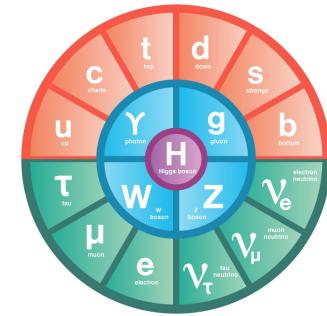

# TO KNOW YOUR FUTURE YOU MUST KNOW YOUR PAST

$$H_g = \int d^3x \frac{1}{2} (E^2 + B^2)$$

Gluons kinetic and potential energy

$$H_a = \int d^3x \frac{9\alpha_s}{16\pi} (E^2 - B^2)$$

Trace anomaly

$a(\mu)$  related to pdfs

$b(\mu)$  possibly related to the J/psi production at threshold

$$M_N = M_q + M_m + M_g + M_a$$

X. Ji PRL 74, 1071 ( 1995) & PRD 52, 271 (1995)

$$M_N = \frac{\langle P | H_{QCD} | P \rangle}{\langle P | P \rangle}$$

$$M_q = \frac{3}{4} \left( a - \frac{b}{1 + \gamma_m} \right) M_N$$

$$M_m = \frac{4 + \gamma_m}{4(1 + \gamma_m)} b M_N$$

$$M_g = \frac{3}{4} (1 - a) M_N$$

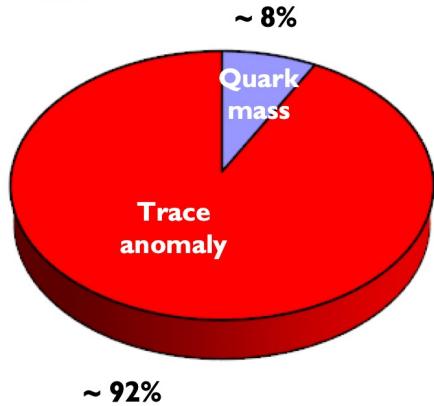

$$M_a = \frac{1}{4} (1 - b) M_N$$

# DIFFERENT MASS DECOMPOSITIONS

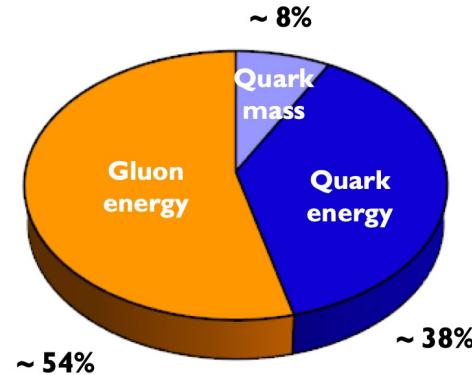

## Proton Mass budget decompositions C. Lorcé (from 2022 INT workshop)

Trace decomposition

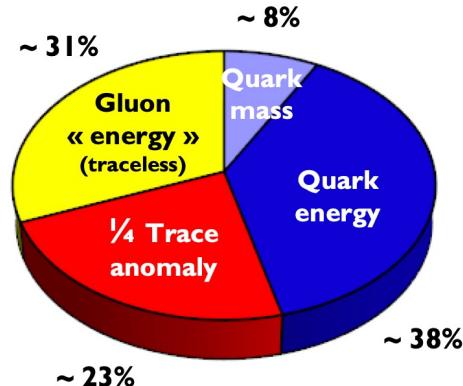

$\mu = 2 \text{ GeV}$

Energy decomposition
