## Space-Time Approach to Quantum Electrodynamics

R. P. FEYNMAN

*Department of Physics, Cornell University, Ithaca, New York*

(Received May 9, 1949)

In this paper two things are done. (1) It is shown that a considerable simplification can be attained in writing down matrix elements for complex processes in electrodynamics. Further, a physical point of view is available which permits them to be written down directly for any specific problem. Being simply a

and presumably consistent, method is therefore available for the calculation of all processes involving electrons and photons.

The simplification in writing the expressions results from an emphasis on the over-all space-time view resulting from a study of the solution of the equations of electrodynamics. The relation

### D. More Complex Problems

Matrix elements for complex problems can be set up in a manner analogous to that used for the simpler cases. We give three illustrations; higher order corrections to the Møller scatter-

## NNLO QCD: $pp \rightarrow \gamma\gamma\gamma + X$

**Figure 1.** Predictions for the fiducial cross-section in LO (green), NLO (blue) and NNLO (red) QCD versus ATLAS data (black). Shown are predictions for six scale choices. The error bars on the theory predictions reflect scale variation only. For two of the scales only the central predictions are shown.

**Figure 2.**  $p_T$  distribution of the hardest photon  $\gamma_1$  (left),  $\gamma_2$  (center) and the softest one  $\gamma_3$  (right). Top plot shows the absolute distribution at NNLO (red), NLO (blue) and LO (green) versus ATLAS data (black). Middle plot shows same distributions but normalized to the NLO. Bottom plot shows central NNLO predictions for 6 different scale choices (only the central scale is shown) with respect to the default choice  $\mu_0 = H_T/4$ . The bands represent the 7-point scale variations about the corresponding central scales.

- Linear equations:

$$\mathbf{g}_0 := \mathbf{R}_0 \mathbf{b} = \lim_{x \rightarrow 0} \mathbf{T}\mathbf{G} \Big|_{O(x^{0+a_j \varepsilon})}$$

- Matrix  $\mathbf{T}$  is horrible-looking depending on  $x$ ,  $\varepsilon$  and  $S_{ij}$ . But

$$\mathbf{R}_0 \mathbf{b} \rightarrow \varepsilon, x, \text{Rationals} \otimes \text{polyLogs} \quad G_i^{(j)} \rightarrow \text{Simple} [S_{ij}] \otimes \text{polyLogs}$$

# 5BOX - ONE LEG OFF-SHELL: P2-3

The two-loop diagram representing the decoupling basis element.

- Basis element 46 for P2 (53 for P3) known from double box P23 family; starts at  $\mathcal{O}(\epsilon^4)$ . [decoupling]

$$q_1 \rightarrow P_{123} - yP_{12}, \quad q_2 \rightarrow yP_1, \quad q_3 \rightarrow P_4, \quad q_4 \rightarrow -P_{1234}, \quad q_5 \rightarrow yP_2$$

$$q_1 \rightarrow P_{123} - xP_{12}, \quad q_2 \rightarrow P_4, \quad q_3 \rightarrow -P_{1234}, \quad q_4 \rightarrow xP_1, \quad q_5 \rightarrow xP_2$$

$$q_1^2 = (1 - y)(S'_{45} - S'_{12}y), \quad s_{12} = S'_{45} - (S_{12} + S'_{23})y, \quad s_{23} = (S'_{34} - S_{12}(1 - y))y,$$

$$s_{34} = S'_{45}, \quad s_{45} = -(S'_{12} - S'_{34} + S'_{51})y, \quad s_{15} = S'_{45} + S'_{23}y$$

$$q_1^2 = (1 - x)(S_{45} - S_{12}x), \quad s_{12} = (S_{34} - S_{12}(1 - x))x, \quad s_{23} = S_{45}, \quad s_{34} = S_{51}x,$$

$$s_{45} = S_{12}x^2, \quad s_{15} = S_{45} + (S_{23} - S_{45})x$$

## 5BOX - ONE LEG OFF-SHELL: P2-3

$$d\vec{g} = \left[ \sum_b d \log(x - \ell_b) M_b + \sum_c d \log(y - \ell_c) \bar{M}_c + d \log(W_{58}(x, y)) \tilde{M}_{58} \right] \vec{g}$$

- all letters  $W_a$ , except  $W_{58}$ , are linear functions only of  $x$  or  $y$ .
- $M$  matrices have zeroes in the row and the column corresponding to the basis element 46 for P2 (53 for P3).
- $\bar{M}$  matrices have non-zero matrix elements only in the row and the column corresponding to the basis element 46 for P2 (53 for P3).
- $\tilde{M}$  matrix have non-zero matrix elements only in the column corresponding to the basis element 46 for P2 (53 for P3).

$$\frac{d\vec{g}'}{dx} = \sum_a \frac{1}{x - \ell_a} M_a \vec{g}'$$
