

# Leptonic and Semi-leptonic Decays at the Belle II Experiment

Nadia Toutounji

USyd-UNSW Meeting, 21.02.2020

THE UNIVERSITY OF  
SYDNEY

# Overview

- The Belle II Experiment
- Prospects and motivation for (semi-)leptonic decays at Belle II
- Analysis strategies and software
- Recent physics results

# The Belle II Experiment

- Successor to Belle - first observation of CP-violation in neutral  $B$ -mesons, along with BaBar in Stanford. *arXiv:hep-ex/0107061*
- SuperKEKB accelerator collides asymmetric beams of 4.0 GeV positrons  $e^+$  and 7.0 GeV electrons  $e^-$
- Center-of-mass energy of collision at  $\Upsilon(4S)$  ( $b\bar{b}$ ) resonance  $\rightarrow$  produces a pair of  $B$ -mesons  $> 96\%$  of the time. *Chin.Phys.C,40,100001*
- Primary aim is to measure the branching fractions of rare decays in the search for new physics
- First collisions April 2018!

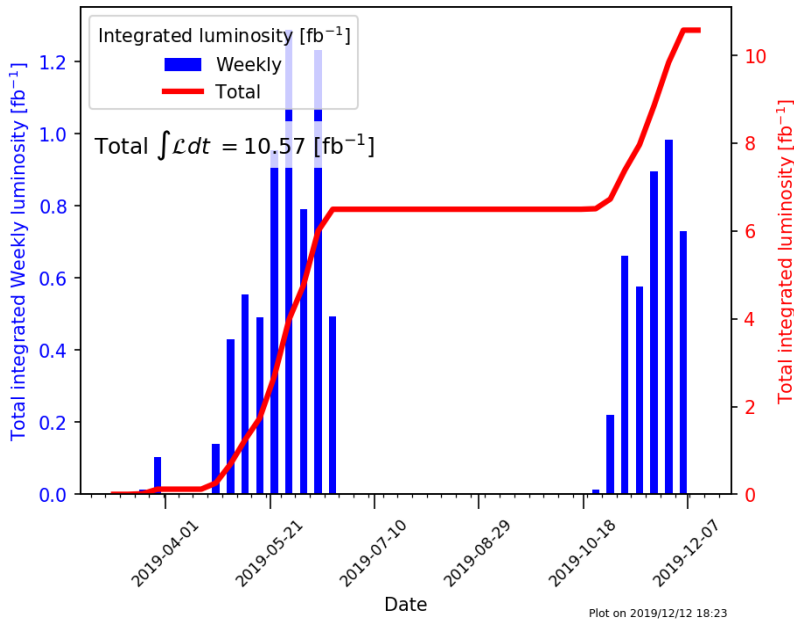

*Phys. Rev. Accel. Beams 19, 121001*

# SuperKEKB

- Collected over  $10 \text{ fb}^{-1}$  of data so far – equivalent to more than 10 million  $B\bar{B}$  pairs
- Target total integrated luminosity of  $50 \text{ ab}^{-1}$  – 50 times larger than Belle

Belle II Online luminosity Exp: 7-8-10 - All runs

# The Belle II Detector

# Why Study (Semi-)Leptonic Decays at Belle II?

**Probe rare decays with sensitivity to new physics:**

e.g.  $B \rightarrow \tau \nu$

A charged Higgs proposed by the Two Higgs Doublet Model (2HDM) could mediate the decay instead of a W boson.

Interference between the two processes would cause a deviation in the branching fraction from SM predictions.

e.g. Tension in  $B \rightarrow X_c \tau \nu$  measurements

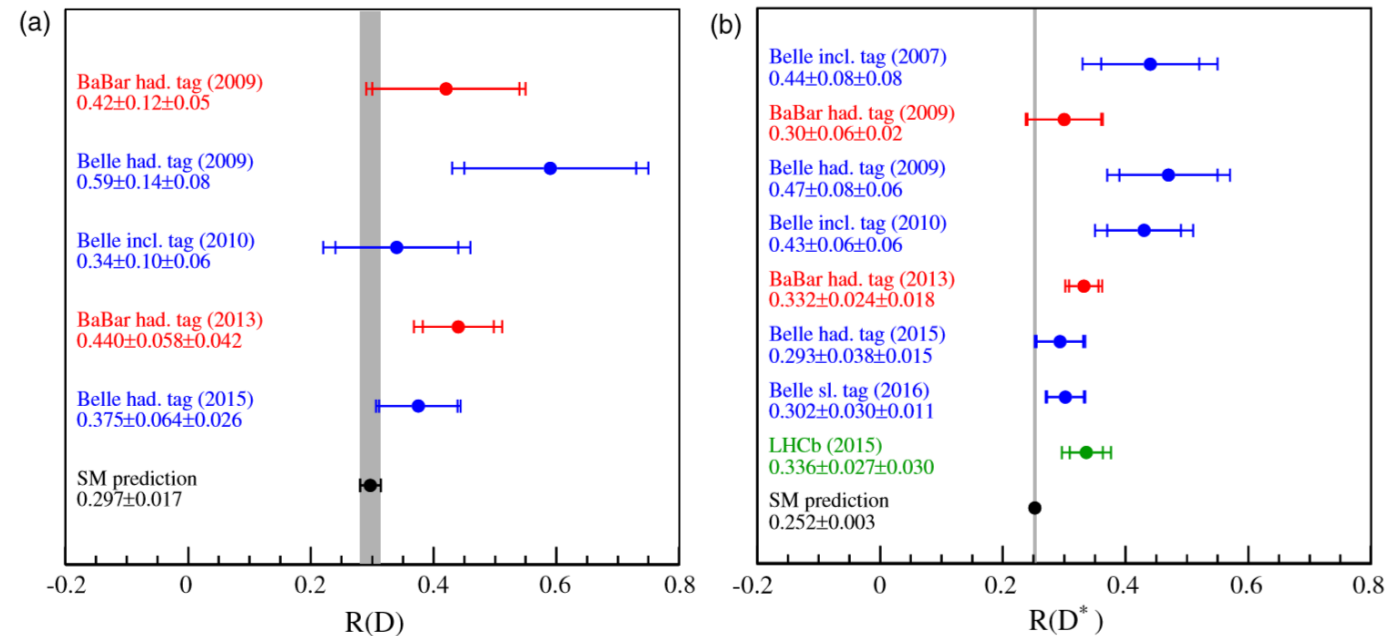

Most recent combined results from Belle and BaBar show a deviation from the SM of  $1.9\sigma$  and  $3.3\sigma$  for  $R(D)$  and  $R(D^*)$

*RevModPhys.88.035008*

$$R(D) = \frac{\Gamma(B \rightarrow D \tau \bar{\nu})}{\Gamma(B \rightarrow D \ell \bar{\nu})} = 0.297 \pm 0.017,$$

$$R(D^*) = \frac{\Gamma(B \rightarrow D^* \tau \bar{\nu})}{\Gamma(B \rightarrow D^* \ell \bar{\nu})} = 0.252 \pm 0.003.$$

SM Prediction

# Why Study (Semi-)Leptonic Decays at Belle II?

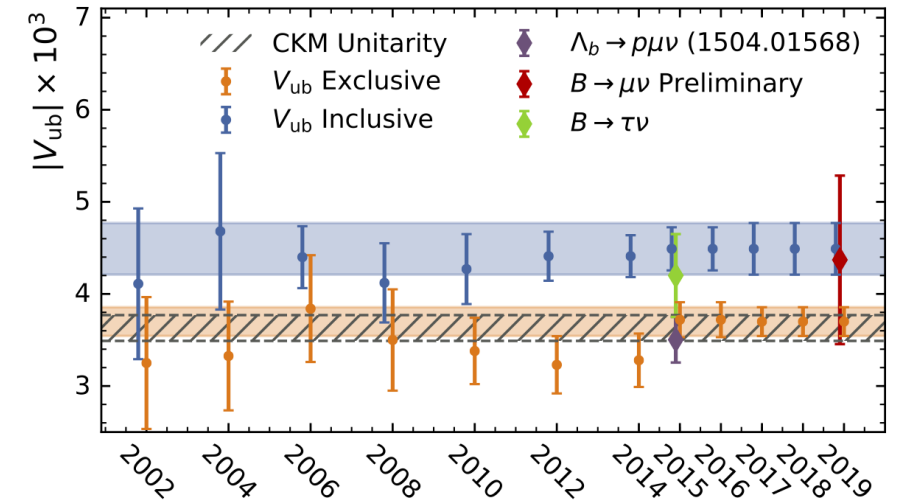

## Precision measurements of Standard Model Parameters:

e.g. extracting  $|V_{ub}|$  from an exclusive analysis of  $B \rightarrow \pi l \nu$  (my thesis topic)

$$V_{\text{CKM}} = \begin{pmatrix} V_{ud} & V_{us} & V_{ub} \\ V_{cd} & V_{cs} & V_{cb} \\ V_{td} & V_{ts} & V_{tb} \end{pmatrix}$$

Credit: Markus Prim

Credit: Markus Prim

## Discovery of rare decays:

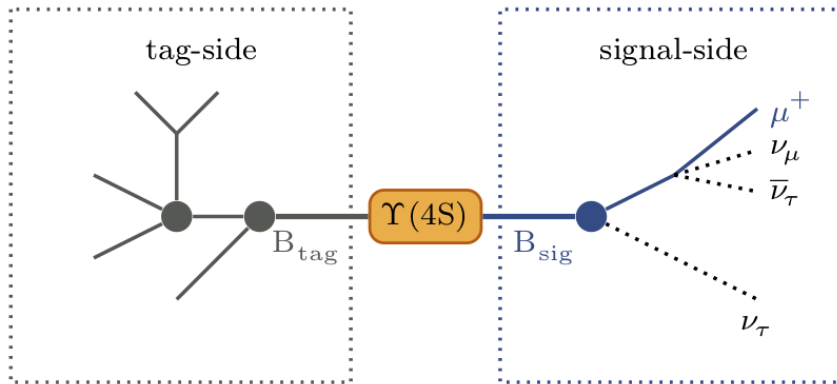

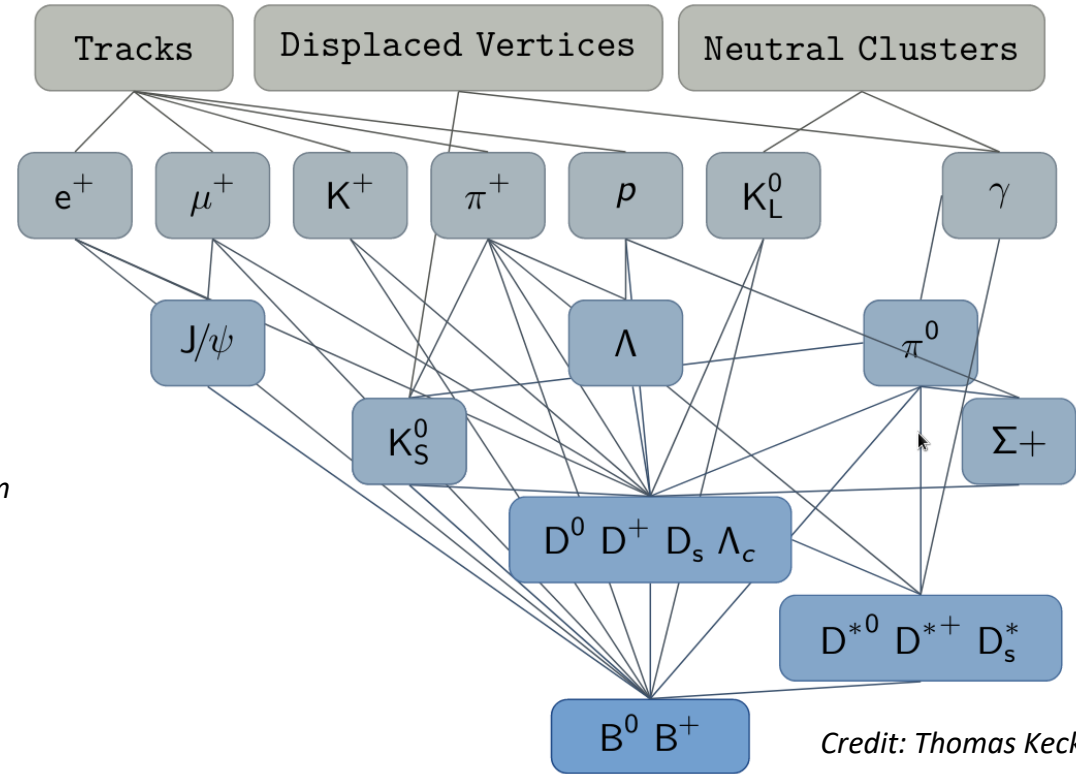

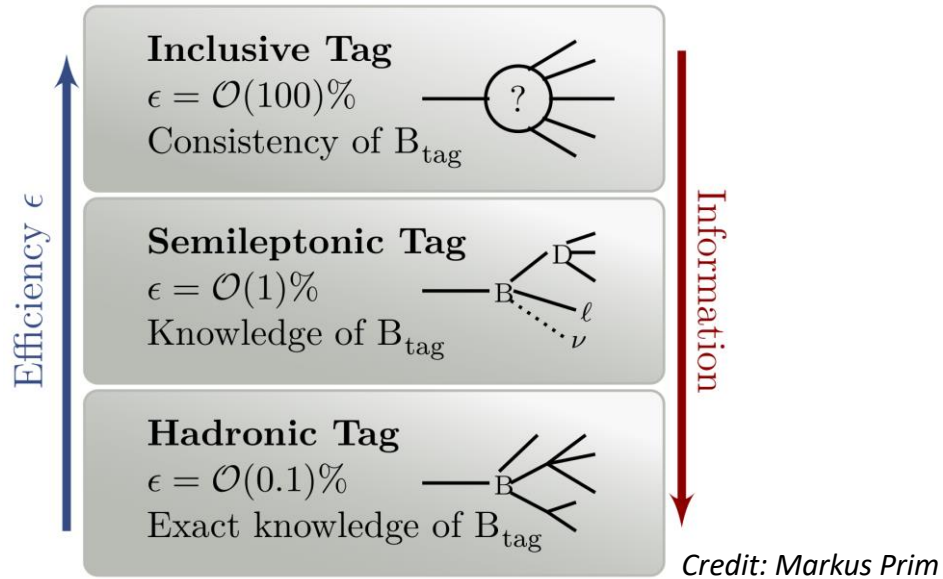

e.g.  $B \rightarrow \mu \nu$

Recent Belle result found a  $2.4\sigma$  excess above background, with a branching fraction of  $\mathcal{B}(B^- \rightarrow \mu^- \bar{\nu}_\mu) = (6.46 \pm 2.22 \pm 1.60) \times 10^{-7}$  and an upper limit of  $10.7 \times 10^{-7}$  at a 90% confidence interval. *Phys. Rev. Lett.* 121, 031801

Belle  $\rightarrow$  Belle II  
 $711 \text{ fb}^{-1} \rightarrow 50 \text{ ab}^{-1}$

## Full Event Interpretation (FEI)

# FEI Performance on Early Data

William Sutcliffe, BELLE2-NOTE-PL-2019-030

(+ cross-check by myself)

$$M_{bc} = \sqrt{E_{beam}^2 - \vec{p}_B^2}$$

# $B_{sig} \rightarrow X e \nu_e$ with Hadronic FEI Tagging

William Sutcliffe, BELLE2-NOTE-PL-2019-030

(+ cross-check by myself)

Reconstruction of an inclusive semi-leptonic signal side recoiling against a hadronic tag.

Only the  $B_{tag}$  and the electron are reconstructed in the event – the neutrino escapes and all other remaining particles are assigned to the X system.

$$M_{miss}^2 = (p_{beam} - p_{B_{tag}} - p_l - p_{\Upsilon(4S)_{ROE}})^2$$

“Re-discovery” of  $B \rightarrow X e \nu_e$  in early Belle II data

# Untagged Analysis of $B^0 \rightarrow D^* l \nu$

Minakshi Nayak, BELLE2-NOTE-PL-2019-008

Here, the signal-side is reconstructed from a lepton and a  $D^*$  meson with decay chain:

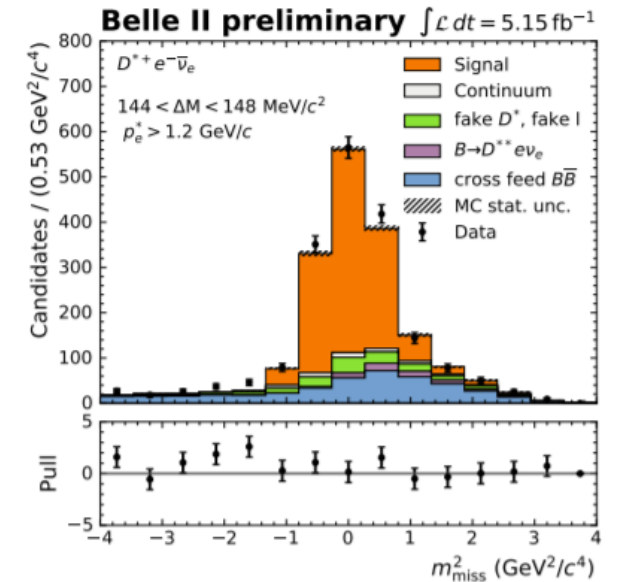

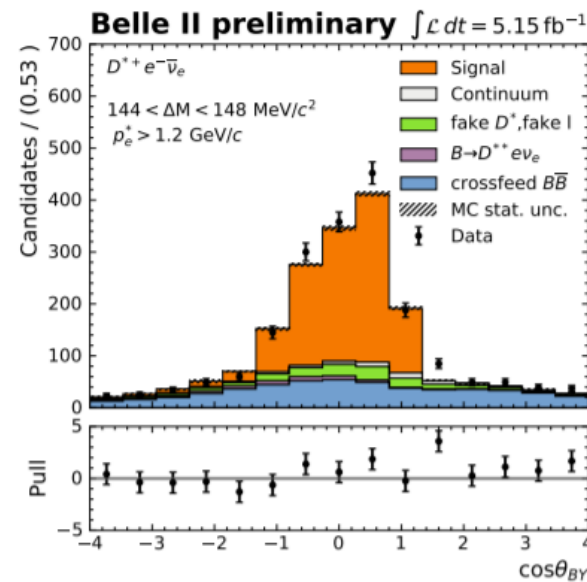

$$D^{*+} \rightarrow D^0(D^0 \rightarrow K^- \pi^+) \pi^+$$

O(1100) events are found for  $B^0 \rightarrow D^* e \nu$ , and O(1200) for  $B^0 \rightarrow D^* \mu \nu$  (not pictured)

$$\cos \theta_{BY} = \frac{2E_B^* E_Y^* - M_B^2 - m_Y^2}{2p_B^* p_Y^*}$$

$$m_{\text{miss}}^2 = \left( \frac{P_{ee}}{2} - P_Y^* \right)^2$$

“Re-discovery” of  $B^0 \rightarrow D^* l \nu$  in early Belle II data

# Summary

- The Belle II Experiment is in full swing and has already collected  $> 10 \text{ fb}^{-1}$  of data
- Upgrades to both the accelerator and detector from Belle aim to produce 50 times the Belle dataset at an improved performance
- Upgraded software tools are also available and currently being used for analysis
- Many prospects for the analysis of (semi-)leptonic decays, with an emphasis on the search for new physics beyond the Standard Model
- Exciting results with this early data-set have already been produced
  - stay tuned for more results in the coming years!
