 - ▶ - Workstations
 - ▶ - Clusters w/wo GPUs

The screenshot shows the website for the Exascale Computing Project (ECP) Co-design Center for Particle Applications (COPA). The page title is "PARTICLE-BASED APPLICATIONS" and it features a navigation menu with links for Home, About, Research, News, Training, and Library. A blue button labeled "< Co-design" is visible. The main content area is divided into two columns: "Project Details" and "Principal Investigator(s)".

Project Details

The Co-design Center for Particle Applications (CoPA) provides contributions to enable application readiness as we move toward exascale architectures for the "motif" of particle-based applications. CoPA focuses on co-design of several "sub-motifs," including short-range particle-particle interactions (e.g., those that often dominate molecular dynamics (MD) and smoothed particle hydrodynamics methods), long-range particle-particle interactions (e.g., electrostatic MD and gravitational N-body), particle-in-cell (PIC) methods, and O(N) complexity electronic structure and quantum MD (QMD) algorithms. Relevant particle applications are represented within CoPA and help drive the co-design process. Exascale Computing Project (ECP) application projects—such as EXAALT (LAMMPS-SNAP), WDMApp (XGC), ExaSky (HACC/SWFFT), and ExaAM (MPM)—serve as application partners as well as non-ECP applications.

Principal Investigator(s):

Susan Mniszewski, PI, Los Alamos National Laboratory; Jim Belak, Co-PI, Lawrence Livermore National Laboratory

Collaborators:

CONCLUSIONS AND OUTLOOK

- ▶ Performance portability (GPU/CPU)
- ▶ Excellent results for the $(2+1)D$ and $(1+1)D$ checks
- ▶ Reproduce data
- ▶ Hydrodynamics with sources terms
- ▶ Check causality near the jet
- ▶ Simulate with more physical parameters
- ▶ Couple with jet simulator

BACKUP

COORDINATE SYSTEM

- ▶ $c = \hbar = k_b = 1$
- ▶ $x^\mu = \{\tau, x, y, \eta_s\}$
- ▶ $\tau = \sqrt{t^2 - z^2}$
- ▶ $\eta_s = \frac{1}{2} \ln \left(\frac{t+z}{t-z} \right)$

DERIVATIVES

► Partial derivatives

$$\partial_k q^* = \sum_{b=1}^N m_b \left[q_b^* \frac{(\sigma_a^*)^{-1}}{(\sigma_b^*)^n} - q_a^* \frac{(\sigma_a^*)^{-1}}{(\sigma_b^*)^n} \right] \partial_k W_{ab}$$

- $n = 0$ usual
- $n = 1$ antisymmetric
- $n = -1$ symmetric

DERIVATIVES

- ▶ Partial time derivatives depends on total derivatives

$$d_0 A^\mu = \frac{dA^\mu}{dx_0} - v^i \partial_i A^\mu + \Gamma_{0\sigma}^\mu A^\sigma,$$

$T^{\mu\nu}$ AND N^μ

► Full

$$N^\mu = nu^\mu + q^\mu$$

$$T^{\mu\nu} = (\varepsilon + P + \Pi)u^\mu u^\nu - g^{\mu\nu}(P + \Pi) + \pi^{\mu\nu}$$

$$\begin{aligned} u^\mu d_\mu &= D, \\ \Delta^{\mu\nu} &= g^{\mu\nu} - u^\mu u^\nu \\ \nabla_\mu &= \Delta_\mu^\alpha d_\alpha \end{aligned}$$

CCAKE: FREEZE-OUT SURFACE

- ▶ Surface $\varepsilon_{fo} = \varepsilon(x = (x^0, x^1, x^2, x^3))$

$$n_\mu = \frac{N_\mu}{\sqrt{|N_\mu N^\mu|}} = - \frac{\partial_\mu \varepsilon_{fo}(x)}{\sqrt{|\partial_\mu \varepsilon_{fo}(x) \partial^\mu \varepsilon_{fo}(x)|}}$$

EXAFLOP

- ▶ 10^{18} operations / second

JET SIMULATION PARAMETERS

$$s_0 = 200 \text{fm}^{-3}$$
