

7th China-Chile Bilateral Conference for Astronomy

Contribution ID: 144 Contribution code: CC07

Type: **Talk**

The ALeRCE broker: a community broker for the Vera C. Rubin Observatory

Friday, January 9, 2026 9:00 AM (25 minutes)

A new time domain ecosystem is developing thanks to a new generation of large aperture and large field of view telescopes, notably the Vera C. Rubin Observatory. Among the tools required are fast machine learning aided discovery and classification algorithms, interoperable tools to allow for an effective communication with the community and follow-up telescopes, and new models and tools to extract the most physical knowledge from these observations. In this talk I will review the challenges and progress of building the Automatic Learning for the Rapid Classification of Events (ALeRCE) astronomical alert broker. ALeRCE (<http://alerce.science/>) is a broker that annotates, classifies and provides access to a living database of variable astronomical objects since 2019. ALeRCE is focused around three scientific cases: transients, variable stars and active galactic nuclei, and has become the 3rd group to report most transient candidates to the Transient Name Server. I will also discuss some of the results based on the real-time ingestion and classification of the Zwicky Transient Facility (ZTF) alert stream and the preparations for the incoming alert stream from the Vera C. Rubin Observatory.

Author: Prof. FORSTER, Francisco (Universidad de Chile)

Presenter: Prof. FORSTER, Francisco (Universidad de Chile)

Session Classification: Invited talk(s)

Track Classification: CC07: New Facilities and Astronomical Instrumentation
