Quantum Tomography at Colliders

Polarization Effects on Common Qubit Pairs at Lepton Colliders

Only s-channel:  $e^-e^+ \rightarrow f\bar{f}$

Massless Final States:  $\mu^-\mu^+$

Massive Final States:  $t\bar{t}$

Bhabha scattering:  $e^-e^+ \rightarrow e^-e^+ / \mu^-\mu^+ \rightarrow \mu^-\mu^+$

Polarization Effect on Tomography

# Quantum Information Observables

1. Concurrence  $\mathcal{C}(\rho) = \max\{0, \lambda_1 - \lambda_2 - \lambda_3 - \lambda_4\}$

$\lambda_i (i = 1, 2, 3, 4)$  are the eigenvalues of  $R = \sqrt{\sqrt{\rho} \tilde{\rho} \sqrt{\rho}}$  in descending order

$\mathcal{C}(\rho) = 0 \Leftrightarrow$  separable (unentangled) states  $\rho = \sum p_i \rho_A^i \otimes \rho_B^i$

$0 < \mathcal{C}(\rho) \leq 1 \Leftrightarrow$  entangled states

2. Bell's Inequality  $|P(\vec{a}, \vec{c}) - P(\vec{b}, \vec{c})| \leq 1 + P(\vec{a}, \vec{b})$

CHSH Inequality  $\mathcal{I}_2 \equiv \langle \hat{A}_1 \hat{B}_1 \rangle + \langle \hat{A}_1 \hat{B}_2 \rangle + \langle \hat{A}_2 \hat{B}_1 \rangle - \langle \hat{A}_2 \hat{B}_2 \rangle \leq 2$

Bell Nonlocality  $\mathcal{B} \equiv \max(\mathcal{I}_2) = 2\sqrt{m_1 + m_2}$

$m_1$  and  $m_2$  are the largest and the second largest eigenvalues of  $C^T C$ .

# Quantum Information Observables: Magic

3. Stabilizer States: States that can be efficiently classically simulated.  $\mathcal{M}_2 = 0$

e.g.  $|\uparrow\downarrow\rangle + |\downarrow\uparrow\rangle, \frac{1}{2}(|\uparrow\uparrow\rangle\langle\uparrow\uparrow| + |\downarrow\downarrow\rangle\langle\downarrow\downarrow|) \dots$

Use Pauli string operators to create stabilizer states:

$$|\psi\rangle = P|\uparrow\uparrow\rangle, P \in \mathcal{P}_n = \{\mathbb{1} \otimes \mathbb{1}, \mathbb{1} \otimes \sigma_i, \sigma_i \otimes \mathbb{1}, \sigma_i \otimes \sigma_j\}$$

“Magic” States: States where quantum computing has advantages.  $\mathcal{M}_2 \neq 0$

The Second Stabilizer Renyi Entropy (“Magic”):

$$\begin{aligned} \mathcal{M}_2 &= -\log_2 \frac{\sum_{P \in \mathcal{P}_n} \text{Tr}(\rho P)^4}{\sum_{P \in \mathcal{P}_n} \text{Tr}(\rho P)^2} \\ &= -\log_2 \frac{1 + \sum_i (B_i^+)^4 + \sum_i (B_i^-)^4 + \sum_{ij} (C_{ij})^4}{1 + \sum_i (B_i^+)^2 + \sum_i (B_i^-)^2 + \sum_{ij} (C_{ij})^2} \end{aligned}$$

# Quantum Information Observables: Magic

3. Stabilizer States: States that can be efficiently classically simulated.  $\mathcal{M}_2 = 0$

e.g.  $|\uparrow\downarrow\rangle + |\downarrow\uparrow\rangle, \frac{1}{2}(|\uparrow\uparrow\rangle\langle\uparrow\uparrow| + |\downarrow\downarrow\rangle\langle\downarrow\downarrow|) \dots$

Use Pauli string operators to create stabilizer states:

$$|\psi\rangle = P|\uparrow\uparrow\rangle, P \in \mathcal{P}_n = \{\mathbb{1} \otimes \mathbb{1}, \mathbb{1} \otimes \sigma_i, \sigma_i \otimes \mathbb{1}, \sigma_i \otimes \sigma_j\}$$

“Magic” States: States where quantum computing has advantages.  $\mathcal{M}_2 \neq 0$

The Second Stabilizer Renyi Entropy (“Magic”):

It depends on the  
quantization basis we  
choose!  
We use helicity basis here:

Quantum Information Observables

## Quantum Tomography at Colliders

Polarization Effects on Common Qubit Pairs at Lepton Colliders

Only s-channel:  $e^-e^+ \rightarrow f\bar{f}$

Massless Final States:  $\mu^-\mu^+$

Massive Final States:  $t\bar{t}$

Bhabha scattering:  $e^-e^+ \rightarrow e^-e^+ / \mu^-\mu^+ \rightarrow \mu^-\mu^+$

Polarization Effect on Tomography

# Quantum Tomography at Colliders

Two methods of quantum tomography:

Kinematic Method

Assuming SM at Production  
Use kinematic variables

Decay Method

Assuming SM at Decay  
Use decay particles

Both can reconstruct the quantum states

# Quantum Tomography at Colliders

Two methods of quantum tomography:

Kinematic Method

$$\mu^- \mu^+, e^- e^+$$

No Decay at Colliders

Decay Method

$$t\bar{t}$$

Decay Channel:  $t\bar{t} \rightarrow \ell q$

A Quick Review of Qubit

Quantum Information Observables

Quantum Tomography at Colliders

**Polarization Effects on Common Qubit Pairs at Lepton Colliders**

Only s-channel:  $e^-e^+ \rightarrow f\bar{f}$

Massless Final States:  $\mu^-\mu^+$

Massive Final States:  $t\bar{t}$

Bhabha scattering:  $e^-e^+ \rightarrow e^-e^+ / \mu^-\mu^+ \rightarrow \mu^-\mu^+$

Polarization Effect on Tomography

# $e^-e^+ \rightarrow \mu^-\mu^+/\tau^-\tau^+$ : Massless and near Z pole

Fully polarized initial state:  $e_R^- e_L^+$

$f_{L/R} = 0$ , Max Parity Violation

$$\mathcal{M} = \frac{e^2 g_{\mu\nu}}{s} J_{in,\pm 1}^\mu (f_V J_{out,V}^\nu + f_A J_{out,A}^\nu)$$

Since  $\gamma/Z$  is spin 1 and in massless limit,  
 $|\psi\rangle \propto a|\uparrow\uparrow\rangle + b|\downarrow\downarrow\rangle$

Initial States:  $|\uparrow\uparrow\rangle$  in  $z$  direction

↓ Project onto

Final States:  $|\uparrow\uparrow/\downarrow\downarrow\rangle$  in  $k$  direction

We can use the Wigner d-matrix:

$$|\psi\rangle \propto f_L d_{1,1}^1(\theta) |\uparrow\uparrow\rangle + f_R d_{-1,1}^1(\theta) |\downarrow\downarrow\rangle$$

$$f_{L,R} = (f_V \pm f_A)/2$$

# $e^-e^+ \rightarrow \mu^-\mu^+/\tau^-\tau^+$ : Massless and near Z pole

Fully polarized initial state:  $e_R^-e_L^+$

$f_{L/R} = 0$ , Max Parity Violation

Max Entanglement at  $\cos \theta_c \sim f_A/f_V$

$$f_V^R = Q_e Q_f + \frac{g_R^e (g_R^f + g_L^f)}{2s_W^2 c_W^2} \frac{s}{s - m_Z^2 + is\Gamma_Z/m_Z}$$

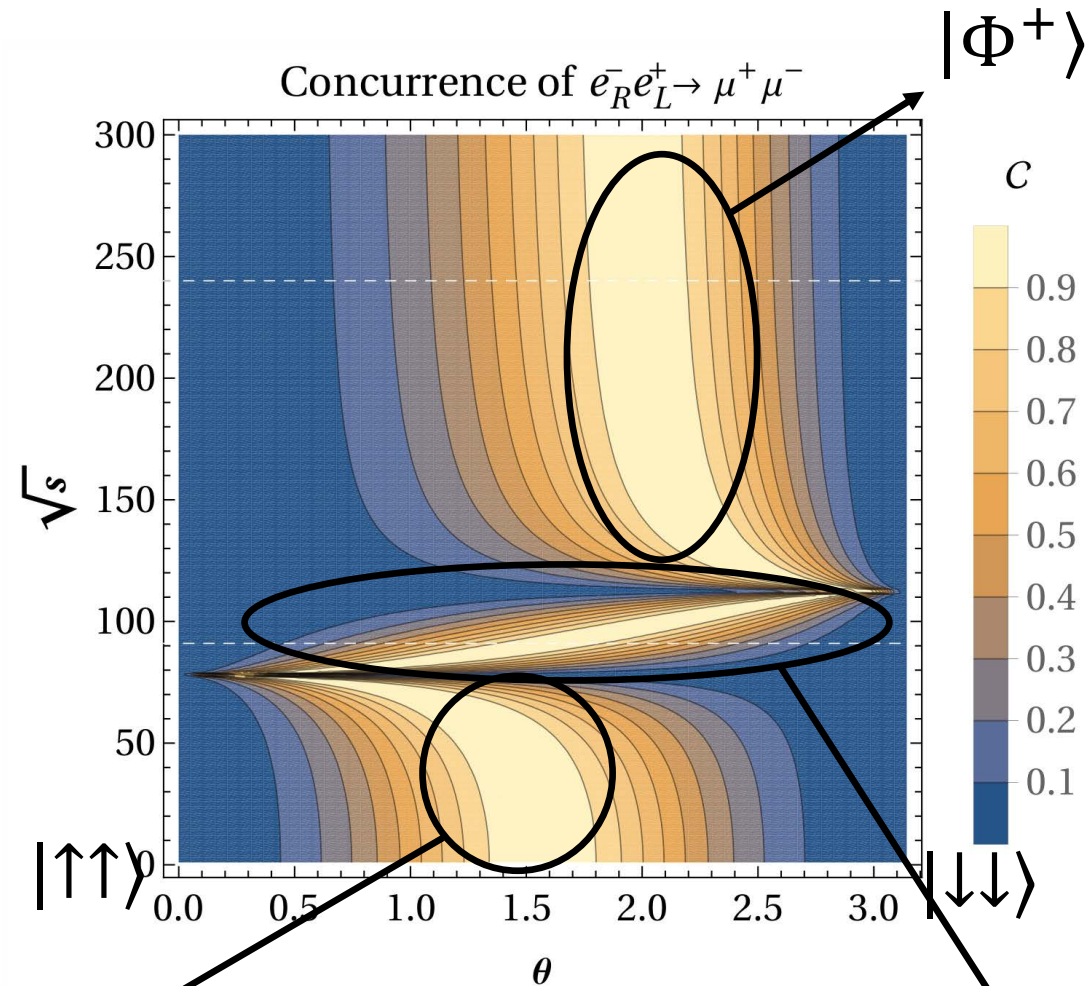

$$f_A^R = \frac{g_R^e (g_R^f - g_L^f)}{2s_W^2 c_W^2} \frac{s}{s - m_Z^2 + is\Gamma_Z/m_Z}$$

As  $\sqrt{s}$  increases,  $f_V, f_A$  changes

$\longrightarrow$   $\cos \theta_c$  changes

# $e^-e^+ \rightarrow \mu^-\mu^+/\tau^-\tau^+$ : Massless and near Z pole

Fully polarized initial state:  $e_R^-e_L^+$

Different Bell state  
at different energy scales

$$|\Phi^+\rangle = \frac{1}{\sqrt{2}} (|\uparrow\uparrow\rangle + |\downarrow\downarrow\rangle)$$

$$|\Phi^-\rangle = \frac{1}{\sqrt{2}} (|\uparrow\uparrow\rangle - |\downarrow\downarrow\rangle)$$

# $e^-e^+ \rightarrow \mu^-\mu^+/\tau^-\tau^+$ : Massless and near Z pole

Fully polarized initial state:  $e_L^- e_R^+$

$e_L^- e_R^+$  looks quite similar with  $e_R^- e_L^+$ !

# $e^-e^+ \rightarrow \mu^-\mu^+/\tau^-\tau^+$ : Polarization Effect

$$\frac{f_V^{RL}}{f_A^{RL}} \sim -\frac{f_V^{LR}}{f_A^{LR}}$$

+

The incoming current  $J_{in,\pm 1}^\mu$

$$\mathcal{C}^{RL}(s, \theta) \sim \mathcal{C}^{LR}(s, \theta)$$

Similar Behavior

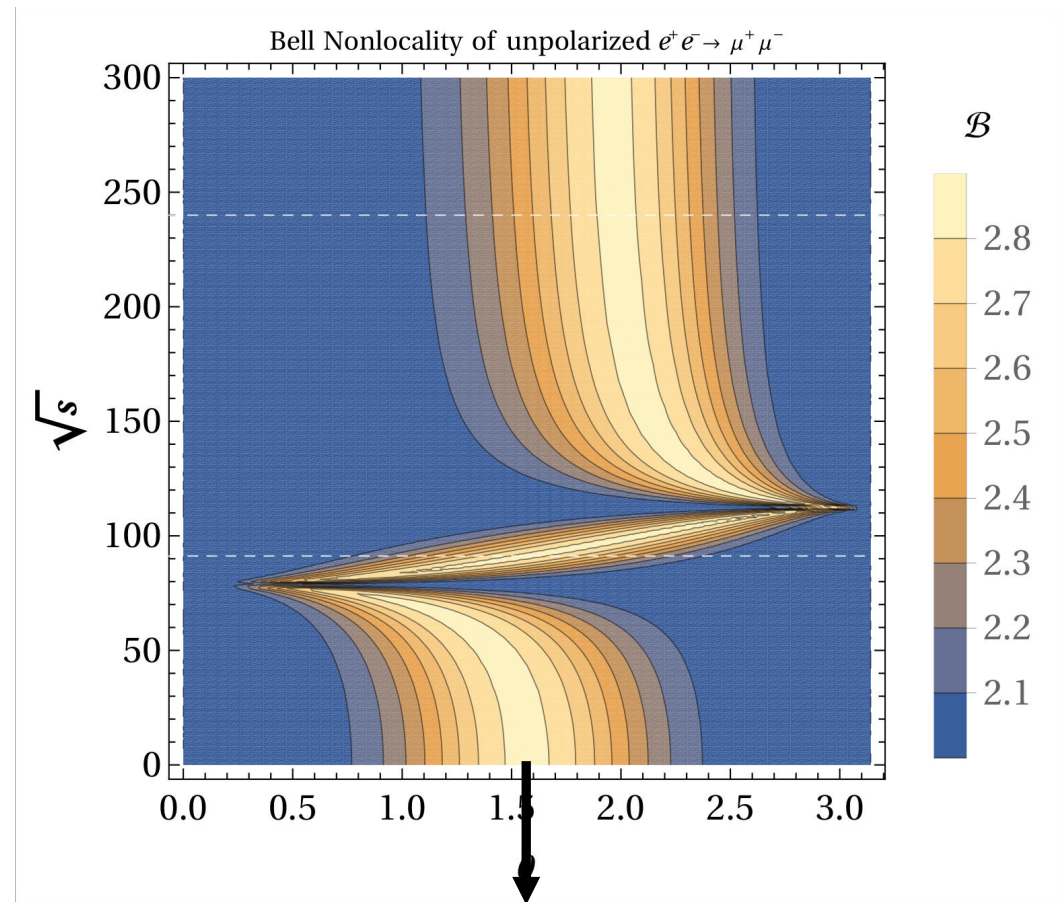

For Different Polarization

# $e^-e^+ \rightarrow \mu^-\mu^+/\tau^-\tau^+$ : Unpolarized Beam

## Unpolarized Beam: Classical mixing of fully polarized case

Max Entanglement  
Close to pure state

Bell State  
 $B = 2\sqrt{2}$

$e^-e^+ \rightarrow \mu^-\mu^+/\tau^-\tau^+$ : Magic

Two Peaks of Magic

Magic is more sensitive to polarization

$e^-e^+ \rightarrow \mu^-\mu^+/\tau^-\tau^+$ : Magic

Two Peaks of Magic

Magic is more sensitive to polarization

Magic is different quantum resource from entanglement!

**Bhabha scattering:  $e^-e^+ \rightarrow e^-e^+ / \mu^-\mu^+ \rightarrow \mu^-\mu^+$**

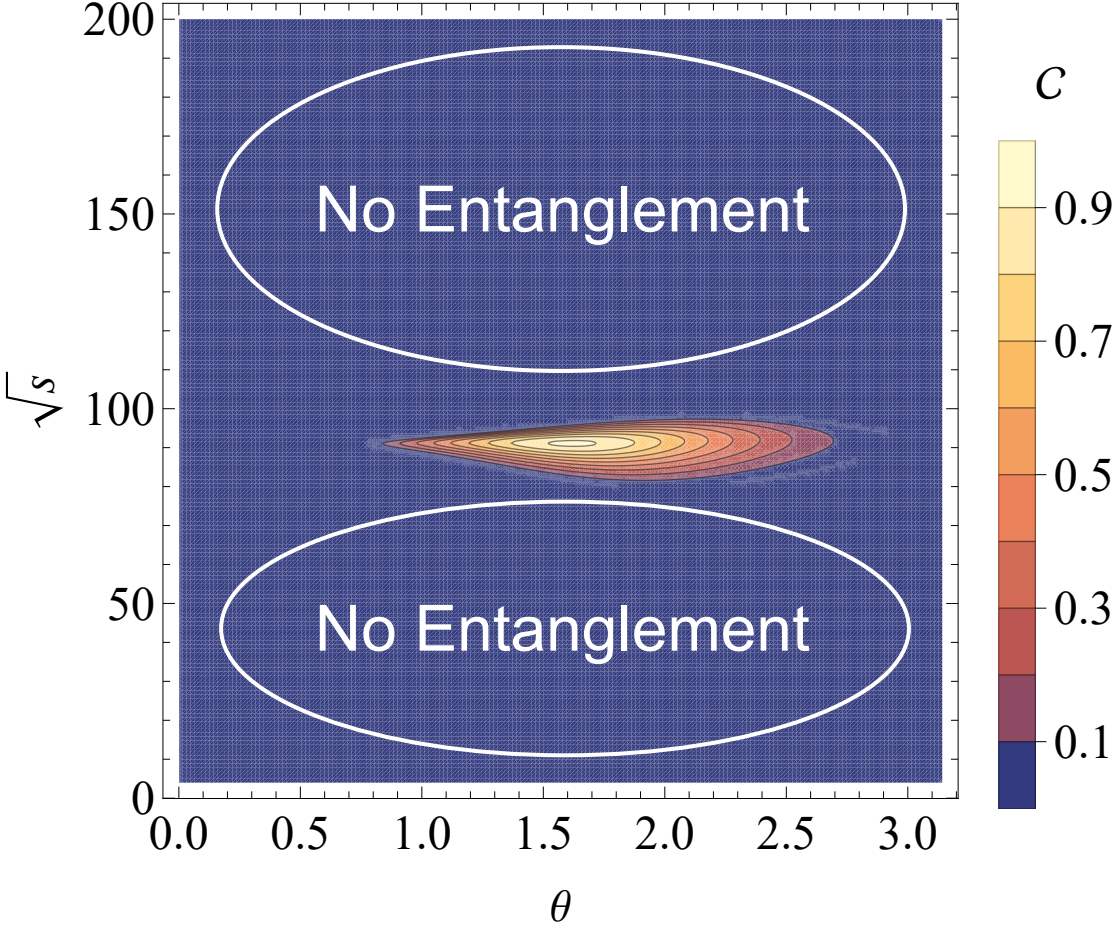

Polarization Effect on Tomography

# Bhabha Scattering: How t-channel influences quantum information?

# Concurrence and Bell Nonlocality for Unpolarized Case

## Concurrence

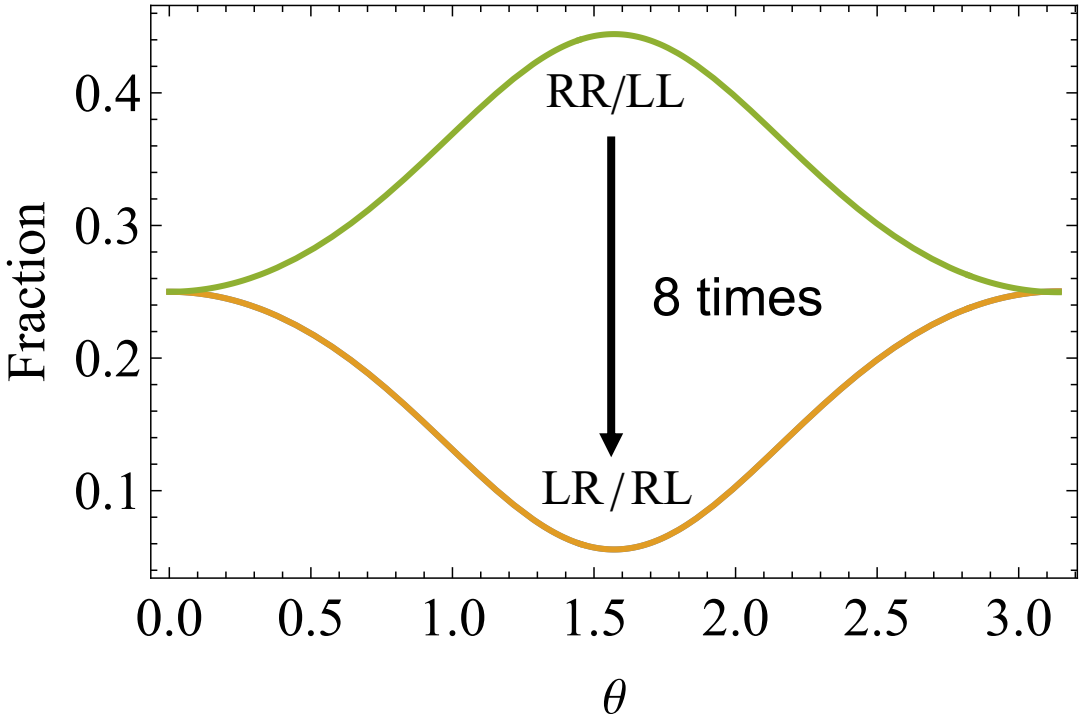

## Bell Nonlocality

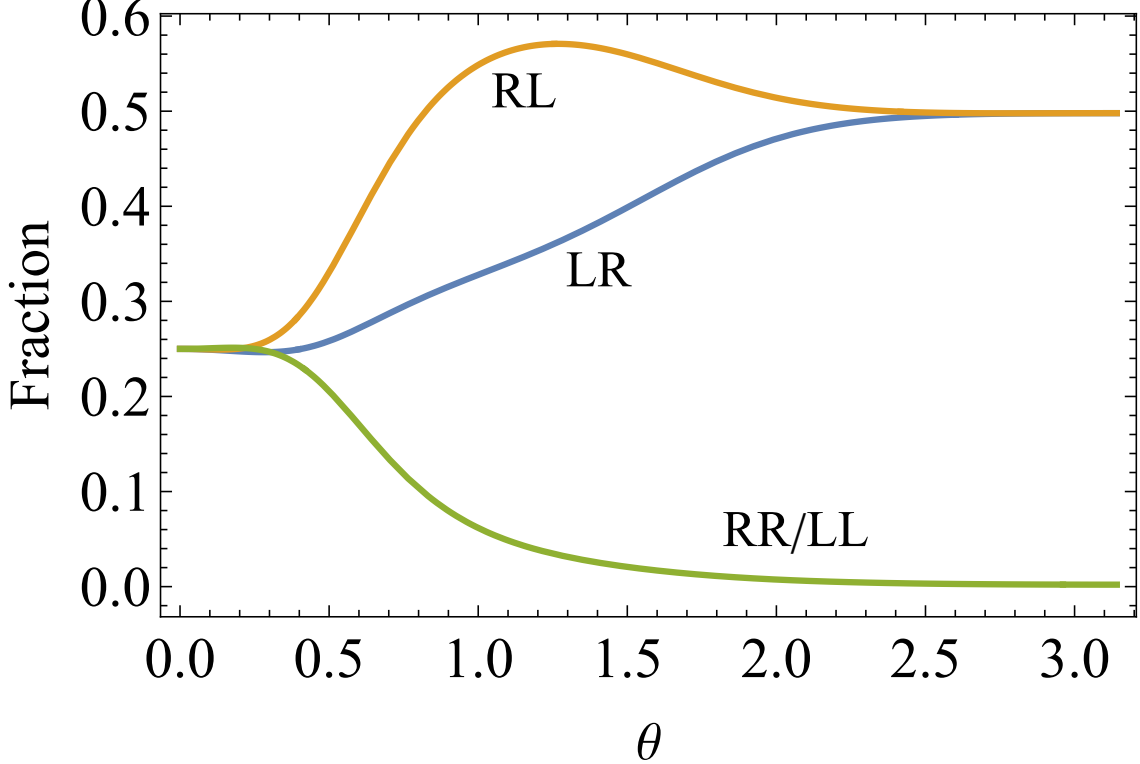

# Reasons of the unpolarized case

## QED Level

t-channel dominates  
especially unentangled process

## Around Z pole

s-channel dominates  
similar with only s-channel process

# Polarized Case: Remove the unentangled pairs

$e_R^- e_L^+$

## Concurrence

$$|\Phi^-\rangle = \frac{1}{\sqrt{2}} (|\uparrow\uparrow\rangle - |\downarrow\downarrow\rangle)$$

High Entanglement

## Bell Nonlocality

$$B = 2\sqrt{2}$$

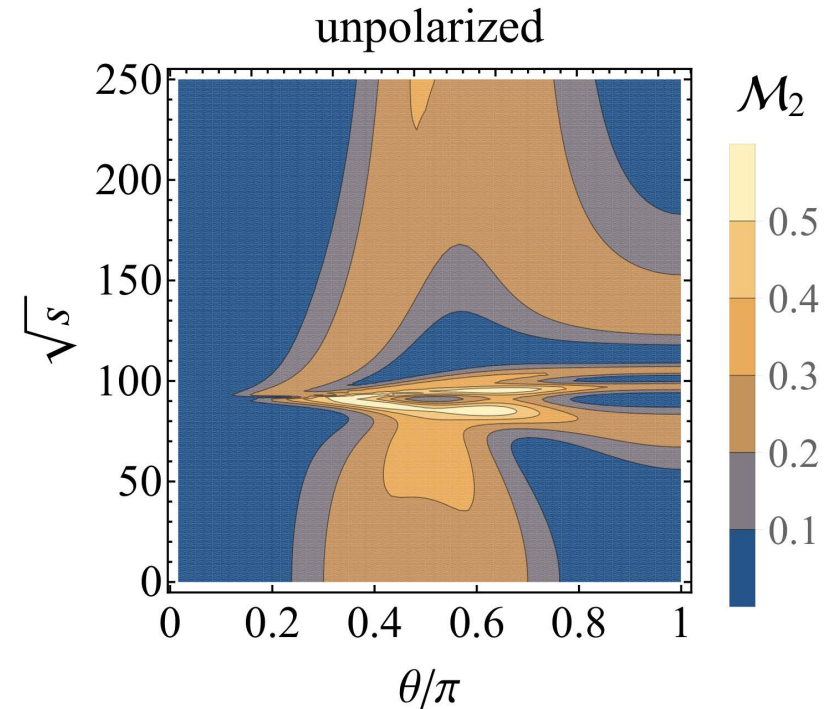

# Magic of Bhabha Scattering

Magic still exhibits two-peak structure.

Unlike entanglement, magic remains nonzero largely.

Full polarized  
two peaks similar with only s-channel

Unpolarized  
changed by t-channel  
with  $RR/LL$  initial states
