

Holography for de Sitter 4-point correlators

Kostas Skenderis

Quantum de Sitter Universe
Cambridge, UK
19 April 2023

Holography

- Gravity is expected to be holographic with any asymptotics.
- However, we only understand in detail the holographic dictionary with special asymptotics (**AdS and power-law asymptotics**).
- Both cases come from explicit realization in string theory via a **near-horizon limit of D-branes**.
- In these cases the dual theory is a **local QFT**.

Holography for de Sitter

- **dS/CFT correspondence** has been proposed more than 20 years ago [Strominger (2001)]
- The status has remained controversial.
- Different formulations/versions have appeared through the years
 - ➡ **Wavefunction of the universe** [Maldacena (2002)] ...
 - ➡ **Domain-wall/cosmology correspondence** [KS, Townsend (2006)] [Bzowski, McFadden, KS (2009-2013)] ...
 - ➡ **Cosmological bootstrap** [Arkani-Hamed et al (2018)]
 - ➡
- There is a **useful and working version** of dS/CFT **perturbatively in $1/N$** .
- It is unclear that such dualities exist **non-perturbatively in $1/N$** .
- There is no known **embedding in/derivation from** string theory.

Issues with de Sitter

- Boundary is spacelike, at future and past infinity
- **Emergent direction is time.**
- Which observables?
- In this work: **in-in cosmological correlators at future infinity**
- Main question:
Can the in-in correlators be expressed in terms of correlators of a local CFT?

Reference

From EAdS to dS

Start from AdS,

$$ds^2 = \frac{\ell_{AdS}^2}{z^2} (dz^2 + d\mathbf{x}^2)$$

and analytically continue:

$$\ell_{AdS}^2 \rightarrow -\ell_{dS}^2, \quad z^2 \rightarrow -\tau^2$$

to obtain dS

$$ds^2 = \frac{\ell_{dS}^2}{\tau^2} (-d\tau^2 + d\mathbf{x}^2)$$

 - Domain-wall/Cosmology correspondence
 - Wavefunction of the Universe
- 2 Asymptotic symmetries and dS/CFT
 - Solution of conformal Ward identities in momentum space
- 3 Summary of results and outlook

Domain-wall/Cosmology correspondence

- EAdS/dS is an example of a more general **Domain-wall / Cosmology correspondence** [KS, Townsend (2006)]

FRW solutions of the theory with potential $V(\Phi)$ \leftrightarrow Domain-wall solutions of the theory with potential $-V(\Phi)$.

Domain-wall solutions

$$\begin{aligned} ds^2 &= dr^2 + e^{2A(r)} dx^i dx^i \\ \Phi &= \Phi(r) \end{aligned}$$

FRW spacetimes

$$\begin{aligned} ds^2 &= -dt^2 + a^2(t) dx^i dx^i \\ \Phi &= \Phi(t) \end{aligned}$$

- This correspondence can be understood as **analytic continuation**.

Inflation/holographic RG correspondence

- A special case of the correspondence is that between inflationary backgrounds and holographic RG flow spacetimes.
- Inflationary spacetimes are mapped to

- asymptotically **Anti-de Sitter spacetime**,

$$ds^2 \rightarrow ds^2 = dr^2 + e^{2r} dx^i dx^i, \quad \text{as } r \rightarrow \infty$$

- **power-law scaling solutions**,

$$ds^2 \rightarrow ds^2 = dr^2 + r^{2n} dx^i dx^i, \quad (n > 1) \quad \text{as } r \rightarrow \infty$$

For special values of n these backgrounds are related to non-conformal branes.

- For these backgrounds there is an established holographic dictionary.

Holographic formulae for cosmology [McFadden, KS (2009)]

- Given an FRW, compute cosmological observables **power spectra, non-Gaussianities** using standard **cosmological perturbation theory**.
 - Corresponding to this FRW there is a domain-wall.
 - Use holography to compute energy-momentum tensor correlators for the QFT dual to the domain-wall.
- ➡ **Comparing the two results leads to holographic formulae** →

Summary

Outline

- 1 dS/CFT and analytic continuation
 - Domain-wall/Cosmology correspondence
 - **Wavefunction of the Universe**
- 2 Asymptotic symmetries and dS/CFT
 - Solution of conformal Ward identities in momentum space
- 3 Summary of results and outlook

Wavefunction of the Universe

- The partition function of the dual QFT computes the **wavefunction of the Universe** [Maldacena (2002)]:

$$\psi[\varphi_{(0)}; \ell_{dS}] = Z_{EAdS}[\varphi_{(0)}; \ell_{AdS}] \Big|_{\text{a.c.}} = Z_{CFT}[\varphi_{(0)}] \Big|_{\text{a.c.}}$$

- Cosmological observables are computed as

$$\langle \varphi_{(0)}(x_1) \cdots \varphi_{(0)}(x_n) \rangle = \int D\varphi_{(0)} |\psi|^2 \varphi_{(0)}(x_1) \cdots \varphi_{(0)}(x_n)$$

- The partition has an expansion in correlation functions:

$$Z_{QFT}[\varphi_{(0)}] = \exp \left(\sum_n \langle O(x_1) \cdots O(x_n) \rangle \varphi_{(0)}(x_1) \cdots \varphi_{(0)}(x_n) \right)$$

$Z_{EAdS}[\varphi_{(0)}; \ell_{AdS}]$

➤ Action:

$$S_{EAdS} = \ell_P^{1-d} \int d^{d+1}x \sqrt{g} \left(\frac{1}{2}(\partial\varphi)^2 + \frac{1}{2}m_{AdS}^2\varphi^2 + \ell_P^{-2}V_{int}(\varphi) \right),$$

➤ Asymptotic solutions:

$$\varphi(z, \vec{x}) = z^{d-\Delta}\varphi_{(0)}(\vec{x}) + \dots + z^{\Delta}\varphi_{(\Delta)}(\vec{x}) + \dots, \quad z \rightarrow 0^+$$

➤ Partition function:

$$\begin{aligned} Z_{EAdS}[\varphi_{(0)}, \ell_{AdS}] &= \int \mathcal{D}\varphi e^{-S_{AdS}} \\ &= \exp\left(\sum_{n=2}^{\infty} \frac{(-1)^n}{n!} \int [d\mathbf{q}_n] \langle \mathcal{O}(\mathbf{q}_1) \dots \mathcal{O}(\mathbf{q}_n) \rangle \varphi_{(0)}(-\mathbf{q}_1) \dots \varphi_{(0)}(-\mathbf{q}_n)\right). \end{aligned}$$

➤ CFT correlators are computed on spacetime with metric:

$$ds_{\text{Bdry}}^2 = \ell_{AdS}^2 d\mathbf{x}^2$$

$\psi[\varphi_{(0)}; \ell_{dS}]$

➤ Action:

$$S_{dS} = -\ell_P^{1-d} \int d^{d+1}x \sqrt{-g} \left(\frac{1}{2} (\partial\varphi)^2 + \frac{1}{2} m_{dS}^2 \varphi^2 + \ell_P^{-2} V_{int}(\varphi) \right)$$

➤ Asymptotic solution:

$$\varphi(\tau, \vec{x}) = (-\tau)^{d-\Delta} \varphi_{(0)}(\vec{x}) + \dots + (-\tau)^\Delta \varphi_{(\Delta)}(\vec{x}) + \dots, \quad \tau \rightarrow 0^-$$

We are consider light fields with Δ real and positive.

➤ Wavefunction:

$$\begin{aligned} \Psi_{dS}[\varphi_{(0)}; \ell_{dS}] &= \langle \varphi_{(0)}(\vec{x}) | 0 \rangle = \int_{\tau=0} \mathcal{D}\varphi e^{iS_{dS}} \\ &= \exp \left(\sum_{n=2}^{\infty} \frac{(-1)^n}{n!} \int [d\mathbf{q}_n] \psi_n(\mathbf{q}_1, \dots, \mathbf{q}_n) \varphi_{(0)}(-\mathbf{q}_1) \dots \varphi_{(0)}(-\mathbf{q}_n) \right) \end{aligned}$$

where $|0\rangle$ is the Bunch-Davies state.

Analytic continuation 1: Planck units

- Work with **Planck units** $\ell_P = 1$:

$$\ell_{AdS} = i\ell_{dS}, \quad \varphi_{(0)}^{AdS} = (-i)^{d-\Delta} \varphi_{(0)}^{dS}$$

- Then **to all orders in perturbation theory**:

$$\psi_n(\mathbf{q}_1, \dots, \mathbf{q}_n) = (-i)^{n(d-\Delta)} \langle \mathcal{O}(\mathbf{q}_1) \dots \mathcal{O}(\mathbf{q}_n) \rangle \Big|_{\ell_{AdS} \rightarrow i\ell_{dS}}$$

- Note that CFT correlators contain factors of ℓ_{AdS} because the boundary metric is $ds_{\text{Bdry}}^2 = \ell_{AdS}^2 d\mathbf{x}^2$.
- This is the form of the continuation used in [\[Maldacena \(2002\)\]](#)
- This is natural from the **bulk perspective** when the r.h.s. is computed via **Witten diagrams**.

Analytic continuation 2

- Work with **AdS/dS units, with $\ell_{AdS} = \ell_{dS} = 1$.**
- This can be obtained by a Weyl transformation that removes ℓ_{AdS} from the boundary metric [Garriga, KS, Urakawa (2014)]. This results in

$$\ell_P^{AdS} \rightarrow -i\ell_P^{dS}, \quad q_{AdS} \rightarrow iq_{dS}, \quad \varphi_{(0)}^{AdS} = \varphi_{(0)}^{dS}$$

- Then

$$\psi_n(\mathbf{q}_1, \dots, \mathbf{q}_n) = (-i)^d \langle \mathcal{O}(\mathbf{q}_1) \dots \mathcal{O}(\mathbf{q}_n) \rangle \Big|_{\ell_P^{AdS} \rightarrow -i\ell_P^{dS}, q_{AdS} \rightarrow iq_{dS}}$$

- Now that CFT correlators are standard correlators in flat space.
- This is the form of continuation that resulted using the domain-wall/cosmology correspondence [McFadden, KS (2009)].
- The **continuation of ℓ_P** can be expressed in CFT language as **$N^2 \rightarrow -N^2$** (when the gauge group in $SU(N)$)).
- This is natural from the **boundary perspective as the continuation ($q \rightarrow iq, N^2 \rightarrow -N^2$) refers only to CFT variables.**

In-in dS correlators

In-in correlators can now be computed by:

- doing the **final integration over $\varphi_{(0)}$** , or
- (equivalently) by using the Schwinger-Keldysh formalism.

$$\begin{aligned} \langle \varphi_{(0)}(\mathbf{q}) \varphi_{(0)}(-\mathbf{q}) \rangle &= \frac{1}{2} \frac{1}{\text{Im} \langle \mathcal{O}(\mathbf{q}) \mathcal{O}(-\mathbf{q}) \rangle}, \\ \langle \varphi_{(0)}(\mathbf{q}_1) \varphi_{(0)}(\mathbf{q}_2) \varphi_{(0)}(\mathbf{q}_3) \rangle &= -\frac{1}{4} \frac{\text{Im} \langle \mathcal{O}(\mathbf{q}_1) \mathcal{O}(\mathbf{q}_2) \mathcal{O}(\mathbf{q}_3) \rangle}{\prod_{i=1}^3 \text{Im} \langle \mathcal{O}(\mathbf{q}_i) \mathcal{O}(-\mathbf{q}_i) \rangle}, \\ \langle \varphi_{(0)}(\mathbf{q}_1) \varphi_{(0)}(\mathbf{q}_2) \varphi_{(0)}(\mathbf{q}_3) \varphi_{(0)}(\mathbf{q}_4) \rangle &= -\frac{1}{8} \left[\frac{\text{Im} \langle \mathcal{O}(\mathbf{q}_1) \mathcal{O}(\mathbf{q}_2) \mathcal{O}(\mathbf{q}_3) \mathcal{O}(\mathbf{q}_4) \rangle}{\prod_{i=1}^4 \text{Im} \langle \mathcal{O}(\mathbf{q}_i) \mathcal{O}(-\mathbf{q}_i) \rangle} \right. \\ &\quad \left. - \left(\frac{\text{Im} \langle \mathcal{O}(\mathbf{q}_1) \mathcal{O}(\mathbf{q}_2) \mathcal{O}(\mathbf{q}_{12}) \rangle \text{Im} \langle \mathcal{O}(-\mathbf{q}_{12}) \mathcal{O}(\mathbf{q}_3) \mathcal{O}(\mathbf{q}_4) \rangle}{\text{Im} \langle \mathcal{O}(\mathbf{q}_{12}) \mathcal{O}(-\mathbf{q}_{12}) \rangle \prod_{i=1}^4 \text{Im} \langle \mathcal{O}(\mathbf{q}_i) \mathcal{O}(-\mathbf{q}_i) \rangle} + (2 \leftrightarrow 3) + (2 \leftrightarrow 4) \right) \right] \end{aligned}$$

where $\mathbf{q}_{ij} = \mathbf{q}_i + \mathbf{q}_j$, and the imaginary part is taken after the **analytic continuation $N^2 \rightarrow -N^2$, $q \rightarrow iq$**

Renormalization

- These formulas continue to make sense also when the l.h.s. diverges as $\tau \rightarrow 0$.
- These infinities are **non-local** from the perspective of the **bulk**.
- They are **local** from the perspective of the **dual CFT**, and can be removed by standard CFT renormalization.
- From the **bulk perspective** one can think of them as **counterterms required for the wavefunction to be normalizable**, or
- as **counterterms in the Schwinger-Keldysh path integral at $\tau = 0$** .

Remarks

- The formulae take **universal form** independent of the order of the perturbation theory.
- Using the same formulae in the regime where the **QFT (and not the bulk) is perturbative yields sensible results.**
[McFadden, KS][Bzowski, KS (2009–2013)][Nastase, KS (2020)]
- This provides **non-geometric holographic models for the very early universe** that are competitive with Λ CDM.
[Easter, Flauger, McFadden, KS (2011)][Afshordi, Coriano, Delle Rose, Gould, KS (2017)]
- It even allows to explicitly investigate the resolution of the Big Bang singularity, which in this context is mapped to the IR finiteness of the dual QFT.

Tree-level

$$ds_{[\Delta\Delta]}^{\text{ren}}(q) = -\frac{1}{2} \frac{1}{\text{Im } i_{[\Delta\Delta]}^{\text{ren}}(iq; -\mu)},$$

$$ds_{[\Delta_1\Delta_2\Delta_3]}^{\text{ren}}(q_i; \mu) = -\frac{1}{4} \frac{\text{Im } i_{[\Delta_1\Delta_2\Delta_3]}^{\text{ren}}(iq_i; -\mu)}{\prod_{j=1}^3 \text{Im } i_{[\Delta_j\Delta_j]}^{\text{ren}}(iq_j, -\mu)},$$

$$ds_{[\Delta_1\Delta_2\Delta_3\Delta_4]}^{\text{ren}}(q_i; \mu) = \frac{1}{8} \frac{\text{Im } i_{[\Delta_1\Delta_2\Delta_3\Delta_4]}^{\text{ren}}(iq_i; -\mu)}{\prod_{j=1}^4 \text{Im } i_{[\Delta_j\Delta_j]}^{\text{ren}}(iq_j; -\mu)},$$

$$ds_{[\Delta_1\Delta_2;\Delta_3\Delta_4x\Delta_x]}^{\text{ren}}(q_i, s; \mu) = \frac{1}{8} \prod_{j=1}^4 \frac{1}{\text{Im } i_{[\Delta_j\Delta_j]}^{\text{ren}}(iq_j; -\mu)} \times$$

$$\left[\text{Im } i_{[\Delta_1\Delta_2;\Delta_3\Delta_4x\Delta_x]}^{\text{ren}}(iq_i, is; -\mu) - \frac{\text{Im } i_{[\Delta_1\Delta_2\Delta_x]}^{\text{ren}}(iq_1, iq_2, is; -\mu) \text{Im } i_{[\Delta_x\Delta_3\Delta_4]}^{\text{ren}}(is, iq_3, iq_4; -\mu)}{\text{Im } i_{[\Delta_x\Delta_x]}^{\text{ren}}(is; -\mu)} \right]$$

Notation: $ds_{[\Delta_1\Delta_2;\Delta_3\Delta_4x\Delta_x]}^{\text{ren}}$: dS in-in exchange diagram, etc.
 $i_{[\Delta_1\Delta_2;\Delta_3\Delta_4x\Delta_x]}^{\text{ren}}$: AdS exchange diagram, etc.

Outline

- 1 dS/CFT and analytic continuation
 - Domain-wall/Cosmology correspondence
 - Wavefunction of the Universe
- 2 Asymptotic symmetries and dS/CFT
 - Solution of conformal Ward identities in momentum space
- 3 Summary of results and outlook

dS isometries and CFT Ward identities

- The **bulk de Sitter isometries** give rise to **Ward identities for cosmological correlators**.
- Under a diffeomorphism $x^\mu \rightarrow x^\mu - \xi^\mu$ by a **Killing vector ξ^μ** :

$$0 = \sum_{i=1}^n \xi^\mu(x_i) \frac{\partial}{\partial x_i^\mu} \langle \varphi(x_1) \dots \varphi(x_n) \rangle.$$

- For ξ^μ the KV for **dilatations** and **special conformal transformations**:

$$0 = \sum \left(\bar{\Delta}_i + \vec{x}_i \cdot \partial_i \right) \langle \varphi_{(0)}(\vec{x}_1) \dots \varphi_{(0)}(\vec{x}_n) \rangle,$$

$$0 = \sum \left(-2\bar{\Delta}_i \mathbf{b} \cdot \vec{x}_i + (x_i^2 \mathbf{b} - 2(\mathbf{b} \cdot \vec{x}_i) \vec{x}_i) \cdot \partial_i \right) \langle \varphi_{(0)}(\vec{x}_1) \dots \varphi_{(0)}(\vec{x}_n) \rangle.$$

- These are **exactly the same** as the **conformal WIs** in d dimensions with $\varphi_{(0)}$ a **conformal field of dimension $\bar{\Delta}_i = d - \Delta_i$** , the shadow dimension.

In-in correlators and shadow fields

- This suggests that the cosmological correlators *are* CFT correlators of fields with shadow dimension $\bar{\Delta} = d - \Delta$, **without any analytic continuation**. Explicit computation at **tree-level** yields:

$$ds_{[\Delta\Delta]} = -\frac{1}{8\bar{\beta}^2 \sin(\pi\bar{\beta})} i_{[\bar{\Delta}\bar{\Delta}]}^{\text{fin}},$$

$$ds_{[\Delta_1, \Delta_2, \Delta_3]} = \frac{2 \sin\left[\frac{\pi}{2}(\bar{\beta}_t + \frac{d}{2})\right]}{\prod_{j=1}^3 4\bar{\beta}_j \sin(\pi\bar{\beta}_j)} i_{[\bar{\Delta}_1, \bar{\Delta}_2, \bar{\Delta}_3]}^{\text{fin}},$$

$$ds_{[\Delta_1 \Delta_2, \Delta_3 \Delta_4]} = -\frac{2 \sin\left[\frac{\pi}{2}(\bar{\beta}_T + d)\right]}{\prod_{j=1}^4 4\bar{\beta}_j \sin(\pi\bar{\beta}_j)} i_{[\bar{\Delta}_1, \bar{\Delta}_2, \bar{\Delta}_3, \bar{\Delta}_4]}^{\text{fin}},$$

$$ds_{[\Delta_1 \Delta_2; \Delta_3 \Delta_4 x \Delta_x]} = \mathcal{B}(\beta_x) i_{[\bar{\Delta}_1 \bar{\Delta}_2; \bar{\Delta}_3 \bar{\Delta}_4 x \bar{\Delta}_x]}^{\text{fin}} + \mathcal{B}(\bar{\beta}_x) i_{[\bar{\Delta}_1 \bar{\Delta}_2; \bar{\Delta}_3 \bar{\Delta}_4 x \bar{\Delta}_x]}^{\text{fin}},$$

here $\bar{\beta}_i = \bar{\Delta}_i - d/2$ and

$$\mathcal{B}(\bar{\beta}_x) = -\frac{2 \sin\left(\frac{\pi}{2}(\bar{\beta}_1 + \bar{\beta}_2 + \bar{\beta}_x + \frac{d}{2})\right) \sin\left(\frac{\pi}{2}(\bar{\beta}_3 + \bar{\beta}_4 + \bar{\beta}_x + \frac{d}{2})\right)}{\sin(\pi\bar{\beta}_x) \prod_{j=1}^4 4\bar{\beta}_j \sin(\pi\bar{\beta}_j)}.$$

Remark

- These relations however are only valid **when renormalization is not needed**.
- When the amplitudes are **finite** one can show that they agree with the ones we derived earlier:
 - Finite correlators of operators of shadow dimensions, $\bar{\Delta} = d - \Delta$, can be obtained from the original ones by **Legendre transform**:

$$\langle O_{\bar{\Delta}}(\mathbf{q}) O_{\bar{\Delta}}(-\mathbf{q}) \rangle = \frac{1}{\langle O_{\Delta}(\mathbf{q}) O_{\Delta}(-\mathbf{q}) \rangle}$$

$$\langle O_{\bar{\Delta}_1}(\mathbf{q}_1) O_{\bar{\Delta}_2}(\mathbf{q}_2) O_{\bar{\Delta}_3}(\mathbf{q}_3) \rangle = \frac{\langle O_{\Delta_1}(\mathbf{q}_1) O_{\Delta_2}(\mathbf{q}_2) O_{\Delta_3}(\mathbf{q}_3) \rangle}{\prod_i \langle O_{\Delta_i}(\mathbf{q}_i) O_{\Delta_i}(-\mathbf{q}_i) \rangle}$$

$$\langle O_{\bar{\Delta}_1}(\mathbf{q}_1) O_{\bar{\Delta}_2}(\mathbf{q}_2) O_{\bar{\Delta}_3}(\mathbf{q}_3) O_{\bar{\Delta}_4}(\mathbf{q}_4) \rangle = \dots$$

- Taking the **imaginary parts** generates the **coefficients with sines**.

Renormalisation

- There is no renormalised version of the relations involving CFT fields with shadow dimensions.
- This is easiest to see with a counterexample.
- We will consider the case, $ds_{[322]}^{\text{ren}}$, the 3-point function of one massless scalars and two conformal scalars.

Outline

- 1 dS/CFT and analytic continuation
 - Domain-wall/Cosmology correspondence
 - Wavefunction of the Universe
- 2 Asymptotic symmetries and dS/CFT
 - Solution of conformal Ward identities in momentum space
- 3 Summary of results and outlook

Conformal Ward identities

- The conformal Ward identities in momentum space for 3-point functions boil down to [Bzowski, McFadden, KS] (2013).:

$$0 = K_{12} \langle \mathcal{O}_1(\mathbf{p}_1) \mathcal{O}_2(\mathbf{p}_2) \mathcal{O}_3(\mathbf{p}_3) \rangle = K_{23} \langle \mathcal{O}_1(\mathbf{p}_1) \mathcal{O}_2(\mathbf{p}_2) \mathcal{O}_3(\mathbf{p}_3) \rangle,$$

where $(i, j=1, 2, 3)$

$$K_{ij} = K_i - K_j, \quad K_j = \frac{\partial^2}{\partial p_j^2} + \frac{d+1-2\Delta_j}{p_j} \frac{\partial}{\partial p_j}.$$

- This system of differential equations is precisely that defining Appell's F_4 generalised hypergeometric function of two variables. [Coriano, Rose, Mottola, Serino][Bzowski, McFadden, KS] (2013).

General solution of CWI for 3-point functions

- Using separation of variables, one obtains a useful integral representation in terms of a *triple-K integral* integral:

$$\langle \mathcal{O}_{\Delta_1}(\mathbf{p}_1) \mathcal{O}_{\Delta_2}(\mathbf{p}_2) \mathcal{O}_{\Delta_3}(\mathbf{p}_3) \rangle = C_{123} p_1^{\Delta_1 - \frac{d}{2}} p_2^{\Delta_2 - \frac{d}{2}} p_3^{\Delta_3 - \frac{d}{2}} \int_0^\infty dx x^{\frac{d}{2} - 1} K_{\Delta_1 - \frac{d}{2}}(p_1 x) K_{\Delta_2 - \frac{d}{2}}(p_2 x) K_{\Delta_3 - \frac{d}{2}}(p_3 x),$$

where $K_\nu(p)$ is a Bessel function and C_{123} is a constant.

- The integral converges provided

$$\frac{d}{2} - 1 > \sum_{j=1}^3 |\beta_j| - 1, \quad \beta_i = \Delta_i - \frac{d}{2}$$

- The integral can be defined by *analytic continuation* when

$$\frac{d}{2} \pm \beta_1 \pm \beta_2 \pm \beta_3 \neq -2k,$$

where k is any non-negative integer.

Renormalization and anomalies [Bzowski, McFadden, KS (2015)]

- If the equality holds,

$$d/2 \pm \beta_1 \pm \beta_2 \pm \beta_3 = -2k,$$

the integral cannot be defined by analytic continuation.

- Non-trivial subtractions and renormalization may be required and this may result in **conformal anomalies and beta functions**.
- Physically when this equality holds, there are **new terms of dimension d** that one can add to the action (**counterterms**) and/or new terms that can appear in T_{μ}^{μ} (**conformal anomalies**).
- We use dimensional regularisation to regulate the theory

$$d \mapsto d + 2u\epsilon, \quad \Delta_j \mapsto \Delta_j + (u + v_j)\epsilon$$

u, v_j are constants that characterize **the scheme**.

Singularities

- There are four different type of singularities, depending on the choice signs.
- Two of them, $(---)$ and $(+++)$ are **projected out by the holographic formulae**.
- The other two $(-- +)$ and $(+ + -)$ (and permutations) are important in this context.

(- - +) singularities: beta functions

- (- - +) case: $\Delta_1 + \Delta_2 - \Delta_3 = d + 2k$
- Counterterm: $\int d^d x \square^{k_1} \phi_1 \square^{k_2} \phi_2 O_3$
- The source ϕ_3 of O_3 renormalizes and this results in beta functions.
- The conformal Ward Identity is anomalous.
- In the context of dS/CFT, the dS correlator requires renormalization and the beta functions survive the analytic continuation.

Example: $\Delta_1 = 3, \Delta_2 = \Delta_3 = 2, d = 3$

- It satisfies the condition $\Delta_1 + \Delta_2 - \Delta_3 = d + 2k$ with $k = 0$.
- By direct evaluation:

$$i_{[322]}^{\text{ren}}(q_1, q_2, q_3) = (q_2 + q_3) \log\left(\frac{q_t}{\mu}\right) - q_1$$

It satisfies an anomalous CWI.

- The cosmological correlator $ds_{[322]}^{\text{ren}}$ can be explicitly computed:

$$ds_{[322]}^{\text{ren}}(q_1, q_2, q_3) = -\frac{(q_2 + q_3) \log\left(\frac{q_t}{\mu}\right) - q_1}{16q_1^3 q_2 q_3}$$

- **It satisfies an anomalous CWI**, consistent with that of $i_{[322]}^{\text{ren}}(q_1, q_2, q_3)$ and the holographic formula that relates them.

(+ + -) singularities

- $\Delta_1 + \Delta_2 - \Delta_3 = -2k$
- The coefficient of leading divergence is **non-local** and is the **actual correlator**. For example, with $k = 0$:

$$\langle O_{\Delta_1}(\mathbf{q}_1) O_{\Delta_2}(\mathbf{q}_2) O_{\Delta_3}(\mathbf{q}_3) \rangle = c \frac{1}{\epsilon} q_1^{(2\Delta_1-d)} q_2^{(2\Delta_2-d)}$$

The infinity is absorbed in c .

- This is an example of an extremal correlator. In position space:

$$\langle O_{\Delta_1}(\mathbf{x}_1) O_{\Delta_2}(\mathbf{x}_2) O_{\Delta_3}(\mathbf{x}_3) \rangle = \frac{c_{123}}{|\mathbf{x}_1 - \mathbf{x}_3|^{2\Delta_1} |\mathbf{x}_2 - \mathbf{x}_3|^{2\Delta_2}}$$

- It satisfies the non-anomalous Ward identity.
- In the context of dS/CFT, **the infinity survives the analytic continuation**.

Example: $\bar{\Delta}_1 = 0, \bar{\Delta}_2 = \bar{\Delta}_3 = 1$

- It satisfied $\bar{\Delta}_1 + \bar{\Delta}_2 - \bar{\Delta}_3 = -2k$ with $k = 0$.
- These dimensions are the **shadow dimensions of**
 $\Delta_1 = 3, \Delta_2 = \Delta_3 = 2$ in $d = 3$: $\bar{3} = 0, \bar{2} = 1, \bar{2} = 1$, and

$$i_{[3\bar{2}\bar{2}]}^{\text{div}} = \frac{1}{\epsilon} \frac{1}{q_1^3 q_2}$$

This is a non-local infinity and cannot be removed by a counterterm in a local CFT.

⇒ The relation

$$ds_{[\Delta_1, \Delta_2, \Delta_3]} = \frac{2 \sin \left[\frac{\pi}{2} \left(\bar{\beta}_t + \frac{d}{2} \right) \right]}{\prod_{j=1}^3 4 \bar{\beta}_j \sin(\pi \bar{\beta}_j)} i_{[\bar{\Delta}_1, \bar{\Delta}_2, \bar{\Delta}_3]}$$

cannot hold when $\Delta_1 = 3, \Delta_2 = \Delta_3 = 2$ in $d = 3$.

Outline

- 1 dS/CFT and analytic continuation
 - Domain-wall/Cosmology correspondence
 - Wavefunction of the Universe
- 2 Asymptotic symmetries and dS/CFT
 - Solution of conformal Ward identities in momentum space
- 3 Summary of results and outlook

Summary of results

- We provided **holographic formula for 4-point functions** in dS and different looking **analytic continuations are in fact equivalent**.
- We worked out explicit results for **tree-level dS 4-point functions**:
 - external and exchange fields are massless and conformal scalars,
 - general interactions including derivative interaction
- Many of these cases **require renormalisation**.
- **Holographic formulas coming from analytic continuation are always valid**, and are consistent with the **dual CFT being local**.
- Formulation with CFT with shadow dimensions **breaks down when renormalization is needed**.

Outlook

- Extend the results to **different external operators**, including **spinning and heavy massive fields**.
- For the cosmological bootstrap programme, one would need the form of the **anomalous dS Ward identities**.
- It is important to check at least in an example whether the continuation $N^2 \rightarrow -N^2$ **makes sense non-perturbatively**.

Power spectra

➤ Power spectra

$$\Delta_{\mathcal{R}}^2(q) = -\frac{q^3}{16\pi^2} \frac{1}{\text{Im}B(q, N)}, \quad \Delta_{\mathcal{T}}^2(q) = -\frac{q^3}{2\pi^2} \frac{1}{\text{Im}A(q, N)}$$

where

$$\langle T_{ij}(q)T_{kl}(-q) \rangle = A(q)\Pi_{ijkl} + B(q)\pi_{ij}\pi_{kl}$$

where Π_{ijkl} is a projector to the transverse-traceless part and π_{ij} is a transverse projector.

Holographic formulae: 3-point functions

- $\langle \zeta(q_1)\zeta(q_2)\zeta(q_3) \rangle$

$$= -\frac{1}{256} \left(\prod_i \text{Im}[B(\bar{q}_i)] \right)^{-1} \times \text{Im} \left[\langle T(\bar{q}_1)T(\bar{q}_2)T(\bar{q}_3) \rangle + (\text{semi-local terms}) \right]$$

- $\langle \zeta(q_1)\zeta(q_2)\hat{\gamma}^{(s_3)}(q_3) \rangle$

$$= -\frac{1}{32} \left(\text{Im}[B(\bar{q}_1)]\text{Im}[B(\bar{q}_2)]\text{Im}[A(\bar{q}_3)] \right)^{-1} \\ \times \text{Im} \left[\langle T(\bar{q}_1)T(\bar{q}_2)T^{(s_3)}(\bar{q}_3) \rangle + (\text{semi-local terms}) \right],$$

[McFadden, KS (2010), (2011)]

Holographic formulae: 3-point functions

- $\langle \zeta(q_1) \hat{\gamma}^{(s_2)}(q_2) \hat{\gamma}^{(s_3)}(q_3) \rangle$
 $= -\frac{1}{4} \left(\text{Im}[B(\bar{q}_1)] \text{Im}[A(\bar{q}_2)] \text{Im}[A(\bar{q}_3)] \right)^{-1}$
 $\times \text{Im} \left[\langle T(\bar{q}_1) T^{(s_2)}(\bar{q}_2) T^{(s_3)}(\bar{q}_3) \rangle + (\text{semi-local terms}) \right],$
- $\langle \hat{\gamma}^{(s_1)}(q_1) \hat{\gamma}^{(s_2)}(q_2) \hat{\gamma}^{(s_3)}(q_3) \rangle$
 $= - \left(\prod_i \text{Im}[A(\bar{q}_i)] \right)^{-1} \times \text{Im} \left[2 \langle T^{(s_1)}(\bar{q}_1) T^{(s_2)}(\bar{q}_2) T^{(s_3)}(\bar{q}_3) \rangle + (\text{semi-local terms}) \right],$

[McFadden, KS (2011)]

Back

(---) singularities: conformal anomalies

➤ (---) **case**: $\Delta_1 + \Delta_2 + \Delta_3 = 2d + 2k$.

➤ **Counterterm**: $\int d^d \mathbf{x} \square^{k_1} \phi_1 \square^{k_2} \phi_2 \square^{k_3} \phi_3$,
where ϕ_i is the source for O_{Δ_i} and $k_1 + k_2 + k_3 = k$.

➡ This leads to **conformal anomalies**

➡ In the context of dS/CFT, the **conformal anomalies are projected**
out by the analytic continuation and the **dS correlator is finite**.

Equivalently, the sine functions in the formulas with **shadow fields**
provide **a zero that cancels the singularity**.

Back

(+++ singularities

- (++) case: $\Delta_1 + \Delta_2 - \Delta_3 = d + 2k$
- The coefficient of leading divergence is **non-local** and is the **actual correlator**. For example, with $k = 0$:

$$\langle O_{\Delta_1}(\mathbf{q}_1) O_{\Delta_2}(\mathbf{q}_2) O_{\Delta_3}(\mathbf{q}_3) \rangle = c \frac{1}{\epsilon} q_1^{(\Delta_1 - \Delta_2 - \Delta_3)} q_2^{(\Delta_2 - \Delta_1 - \Delta_3)} q_3^{(\Delta_3 - \Delta_1 - \Delta_2)}$$

The infinity is absorbed in c .

- It satisfies the non-anomalous Ward identity.
- In the context of dS/CFT, the **dS correlator is finite** and the **analytic continuation provides the zero to cancel the infinity**.

Equivalently, the sine functions in the formulas with **shadow fields** provide **a zero that cancels the singularity**.
