 **ATLAS**  
EXPERIMENT

# Light Weak DM Motivation

► The **LHC experiments** are producing incredible results, extending reach to more extreme phase-spaces and performing increasingly precise measurements.

► But the lack of any observation of BSM physics motivates **looking elsewhere** too.

# Light Weak DM Motivation

- ▶ Main region of interest is for new particles that satisfy DM relic density requirements.

Surviving DM density:  $\Omega_X \propto \frac{m_X^2}{\epsilon_X^4}$

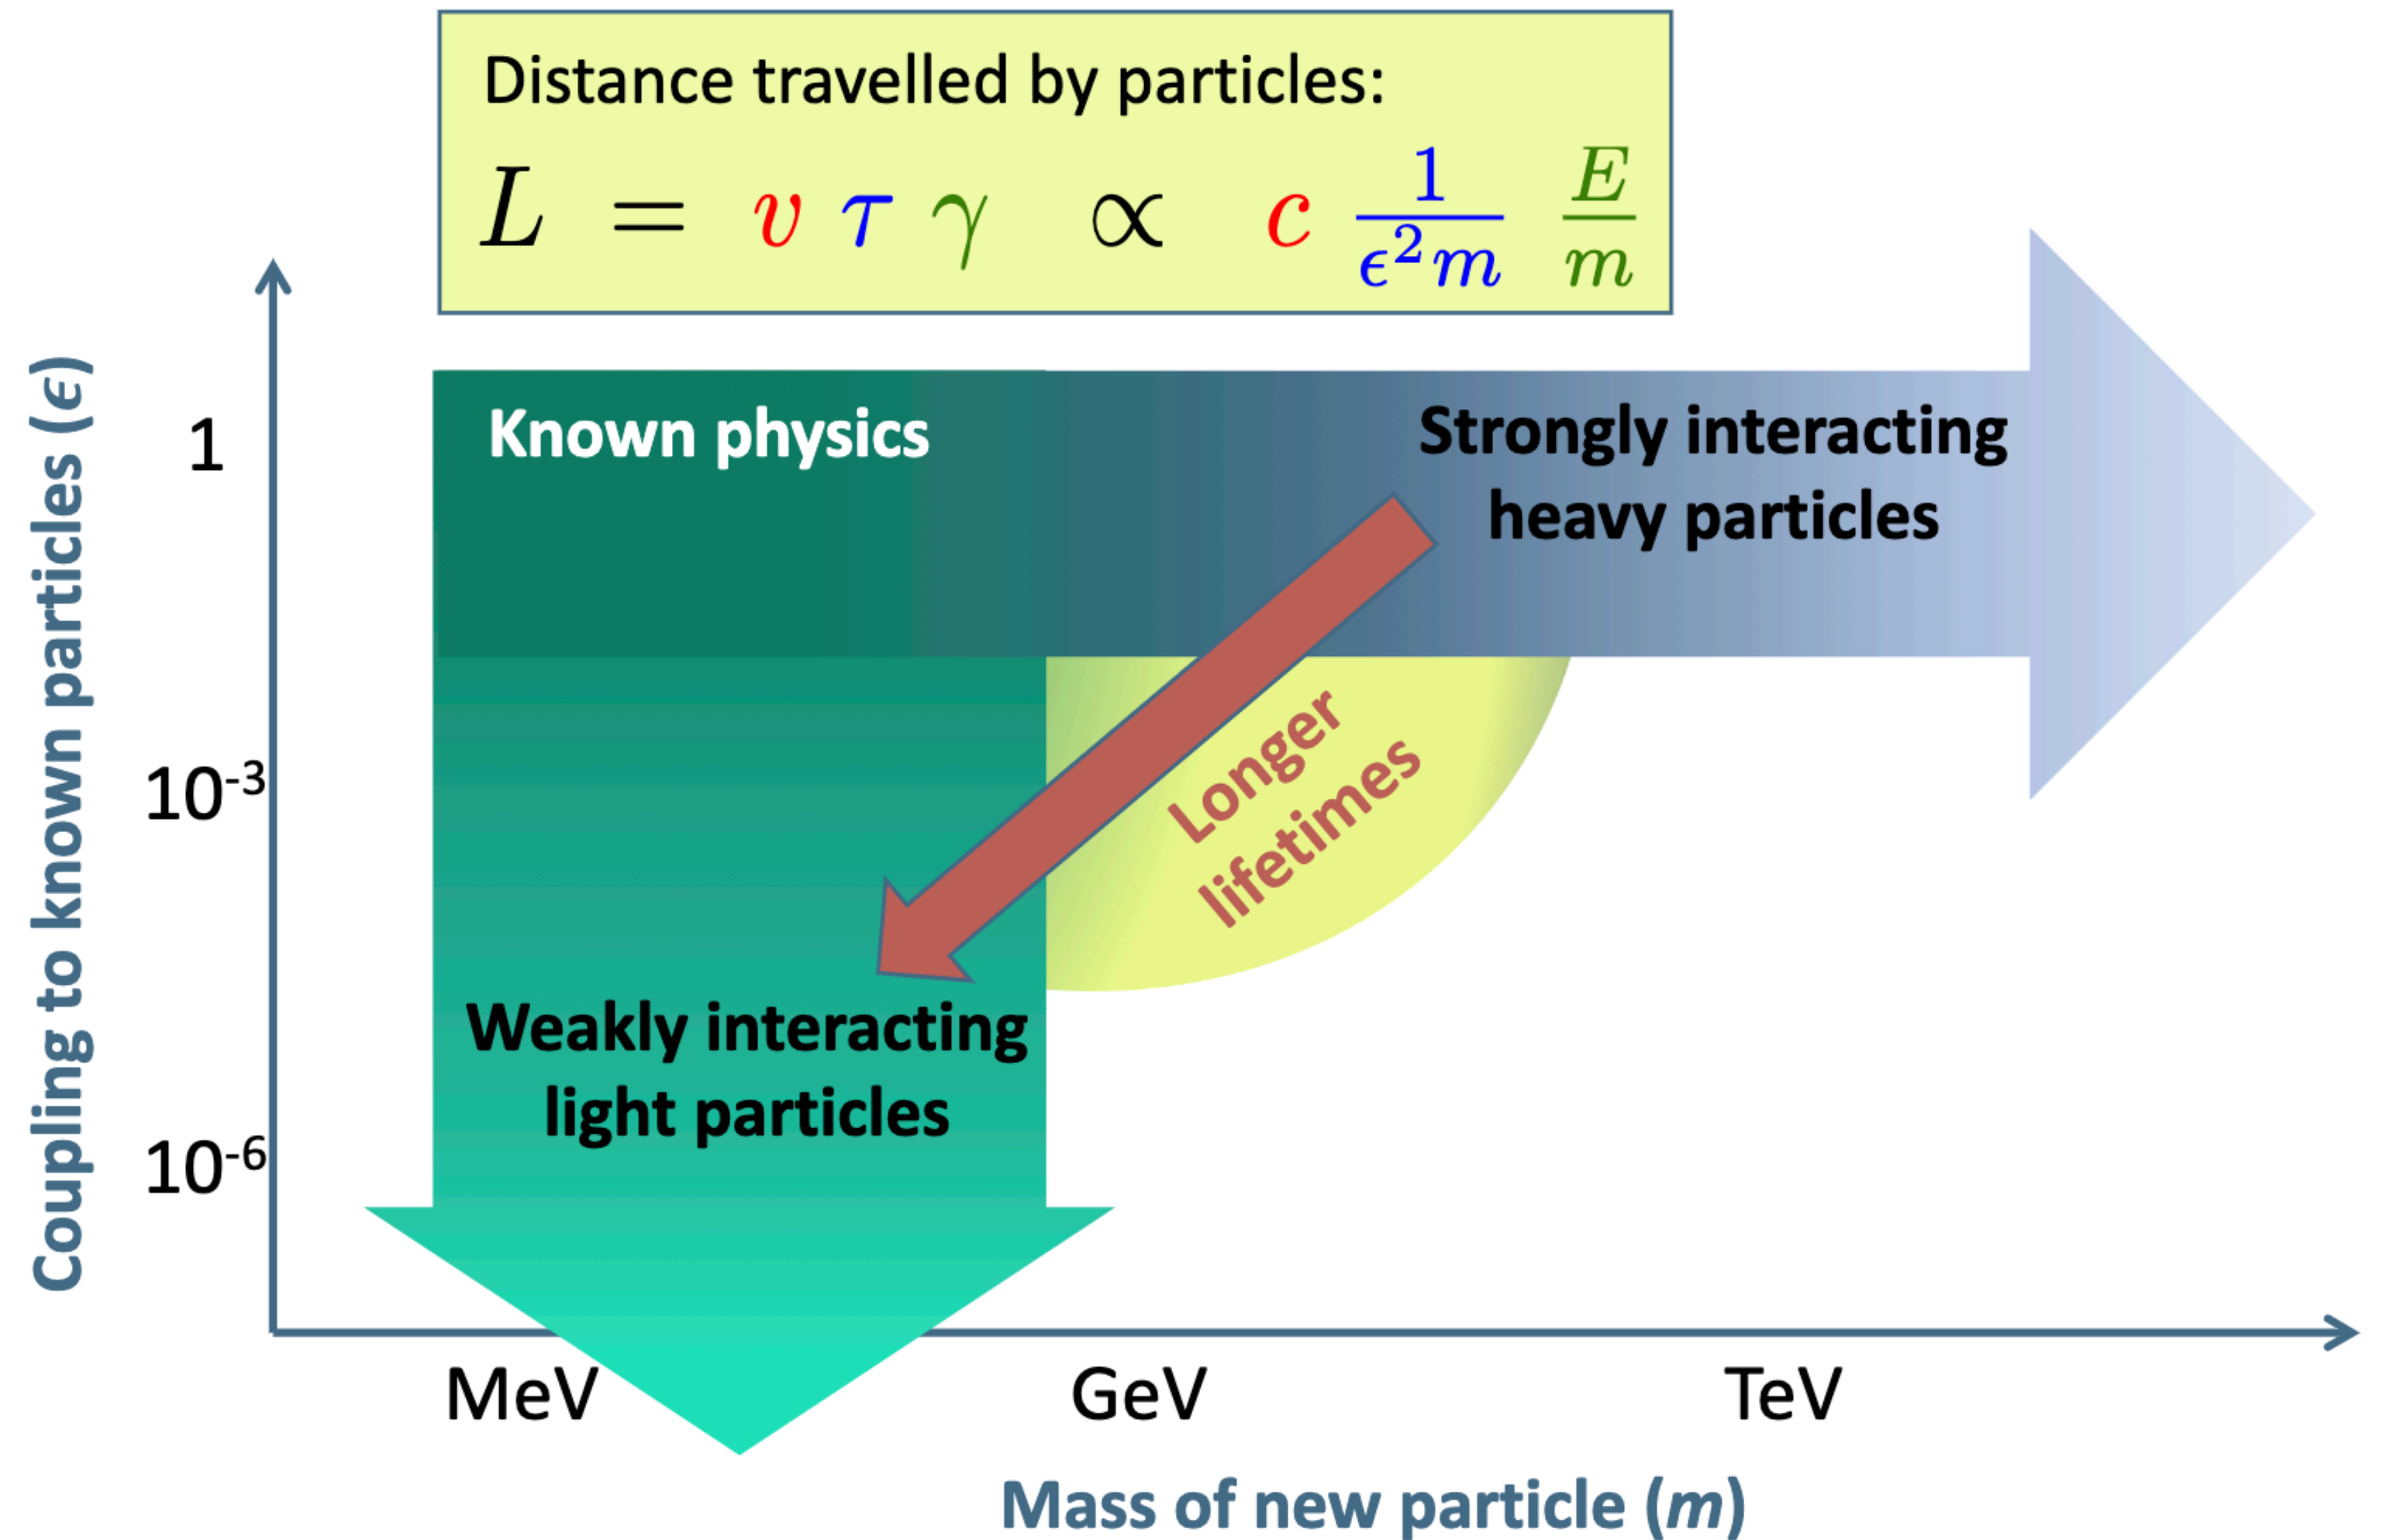

# Light Weak DM Motivation

▶ One of the defining characteristics of weakly interacting light particles is their **long lifetime**.

▶ Distinct signatures

▶ But could still be produced in large numbers in hadron decays at ATLAS!

- ▶ FASER is a new experiment at CERN!
- ▶ Data-taking starts in Run 3

- ▶ Detector is 480m from ATLAS IP1
  - ▶ Directly in line with beam collision axis.
  - ▶ Transverse radius of only 10cm covering the mrad regime ( $\eta > 9.1$ )
- ▶ Inelastic pp cross section is huge  $\rightarrow 10^{16}$  collisions in Run 3  $\rightarrow 10^{17} \pi, 10^{13} B$ 
  - ▶ From only  $10^{-8}$  of solid angle 1% of  $\pi_0$ s are in acceptance.

▶ The T112 service tunnel just happens to be in just the right place for FASER:

- ▶ Old SPS → LEP tunnel
  - ▶ On line-of-sight (with some digging)
  - ▶ Shielded by ~100m rock/concrete
  - ▶ Low beam backgrounds
    - ▶ Charged particles bent by LHC magnets

# FASER Location

► In relation to ATLAS at Point 1

# FASER Now Installed!

# FASER Now Installed!

# FASER Now Installed!

**FASER**

Decay

Long-lived particle

**ATLAS**

LHC collision

# FASER Detector

The detector consists of:

- Scintillator veto
- 1.5m long decay volume
- 2m long spectrometer
- EM calorimeter

# Target scenarios | Dark photon

# Target scenarios | Dark photon

▶ Expected sensitivity of FASER for **dark photons**

▶ Detector signature:

- ▶  $A' \rightarrow e+e^-$
- ▶ Charged tracks appearing in decay volume
- ▶ Opposite charges separate through detector
- ▶ Significant energy deposit in calorimeter

▶ Sensitivity

- ▶ Considers all production channels
- ▶ Assumes no background, requires  $N=3$  events
- ▶ Reach limited by decay length (high  $\epsilon$ ) and production rate (low  $\epsilon$ )

▶ **New parameter space probed with just  $1 \text{ fb}^{-1}$  in 2022**

# FASER Upgrade for HL-LHC?

- ▶ The existing FASER experiment is already set to probe new phase space.
- ▶ But FASER's size is heavily constrained by the available space underground
- ▶ The potential reach with an enlarged detector "FASER2" is under study
  - ▶ Decay Volume: Length=5m, Diameter=2m
- ▶ 4 orders of magnitude improvement in Reach
  - ▶ Angular acceptance of all neutral pions:
    - ▶ 0.6% in FASER
    - ▶ 10% in FASER2
  - ▶ Improves sensitivities to LLPs produced in decays of heavy mesons
  - ▶ Improves sensitivity to larger LLP masses

# FASER2 Reach

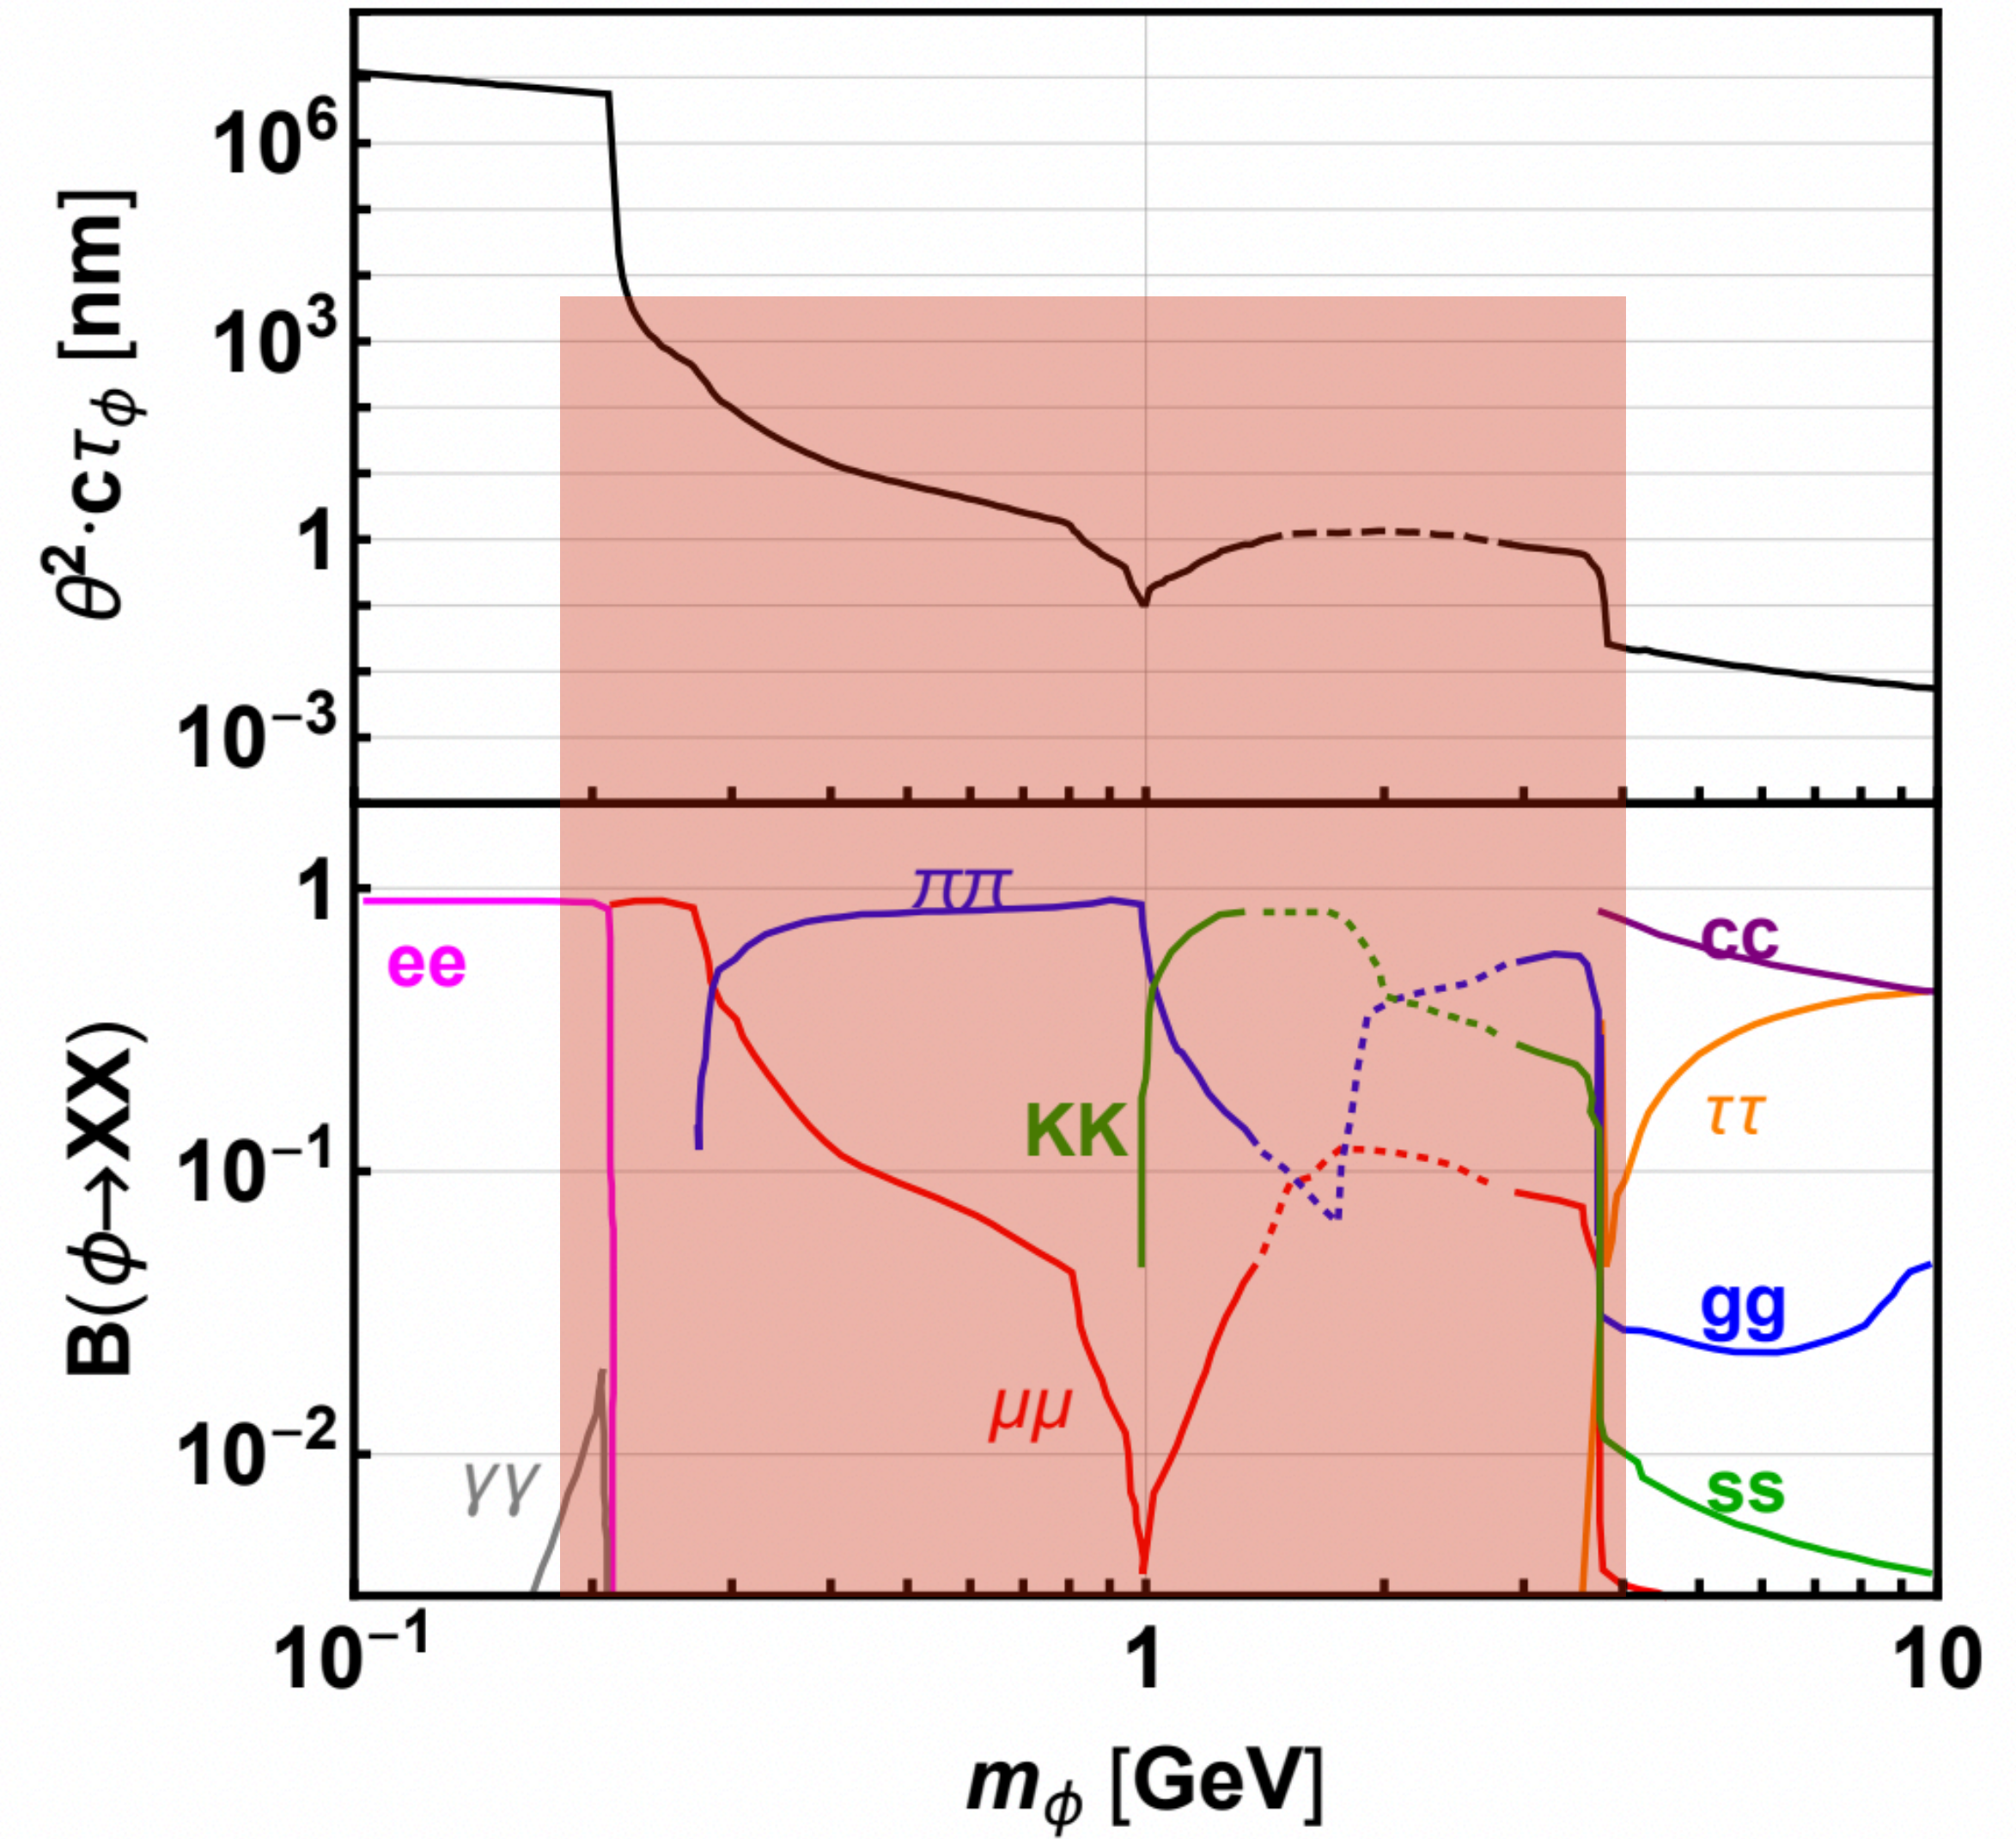

# FASER2 Reach

# FASER2 Reach

## ▶ Design considerations for FASER2

- ▶ Larger radius → Being on-axis less important
- ▶ More decay channels → Need for particle ID
- ▶ Larger decay product separations → Different/cheaper technology
- ▶ Larger detector → Larger background rate

- ▶ Still much to be studied in terms of possible detector configurations and technologies.

## ► Design considerations for FASER2

- Larger radius → Being on-axis less important
- More decay channels → Need for particle ID → **Dual Readout Calo?**
- Larger decay product separations → Different/cheaper technology
- Larger detector → Larger background rate

- Still much to be studied in terms of possible detector configurations and technologies.

# FASER2 Location - The FPF

► There has been recent work to define the civil engineering work required, detector designs and physics reach for a dedicated Forward Physics Facility (FPF)

► [\[arxiv:2109.10905\]](https://arxiv.org/abs/2109.10905)

▶ Available space for FASER2 based on different facility scenarios:

### Scenario 1 (S1)

- “Alcoves” in existing tunnel

### Scenario 2 (S2)

- New dedicated cavern

▶ Possible detector configurations:

FPF Scenario	Distance to IP [m]	Available Length [m]	Decay Volume Length [m]	Available Diameter [m]	Decay Volume Diameter [m]
F2: Original FASER2	480	15	5	2	2 (/ 1 / 0.5)
S1: UJ12 Alcoves	500	5	1.5 (/ 2)	1.52	2 / 1 (/ 0.5)
S2: Purpose-Built Facility	620	25	10 (/ 15 / 20)	2	2 / 1 (/ 0.5)

▶ **FASER2-default**

▶ **Scenario 1:**

▶ Significantly degraded sensitivity due to reduced decay volume length

▶ **Scenario 2:**

▶ Comparable sensitivity to FASER2-default, but somewhat improved due to larger decay volume length.

▶ Very small degradation in diagonal due to increased distance from IP.

► **FASER2-default**

► **Scenario 1:**

► Significantly degraded sensitivity due to reduced decay volume length

► **Scenario 2:**

► Diameter of detector much more important here. Due to larger angle emission from B-hadrons of LLP.
