- (5) Nuisance Parameters & Fit Handling
- (6) Conclusion

# Overview

→ Higgs with mass @ 125GeV does not rule out its composite nature.

→ Naturalness & the Hierarchy Problem still persist.

→ “Heavy Vector Triplet” (HVT) predicts new resonances decaying to a Higgs & SM Vector Boson:

→ Run 1 yielded constraints:

→ ATLAS excluded @ 95% CL  $W'$  ( $Z'$ ) mass at 1.47 (1.36) TeV

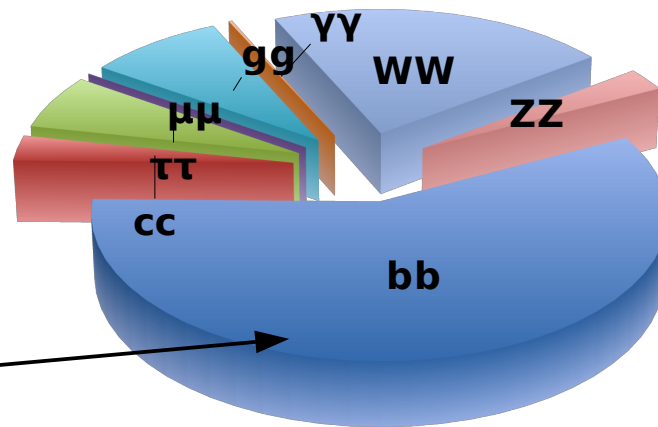

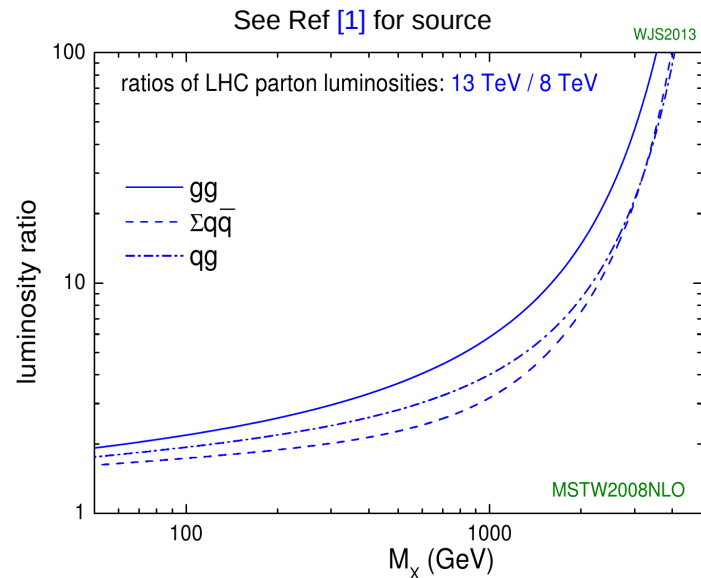

→ CMS excluded  $V' \rightarrow VH$  @ 1.7 TeV

Ref [2]

Ref [3]

→ Run 2 increase in  $\sqrt{s}$  from 8TeV → 13TeV leads to increase in parton luminosity

→  $H \rightarrow bb$  BR ~ 57.8% @ Higgs Mass

# Event Topology & Selection

→ Searching for  $m_{VH}$  system  $> 1.5$  TeV

→ **Boosted Topologies**

→ Use **fat-jets** with  $\Delta R = 1.0$  & **sub-structure techniques**

→ Leptonic decays of SM V used as topological trigger.

**Anti-kT R = 1.0 "fat-jet":**

$p_T > 250$  GeV

**Anti-kT R = 0.2 "track-jets":**

$p_T > 10$  GeV

$\geq 1$  ghost associated b-jet

**$\nu\nu, l\nu, ll$  Vector Boson Decay:**

Lepton  $p_T \geq 60$  GeV (25 GeV)

$E_{miss}^T > 100 - 200$  GeV

# V+Jets Background & Deriving a Systematic

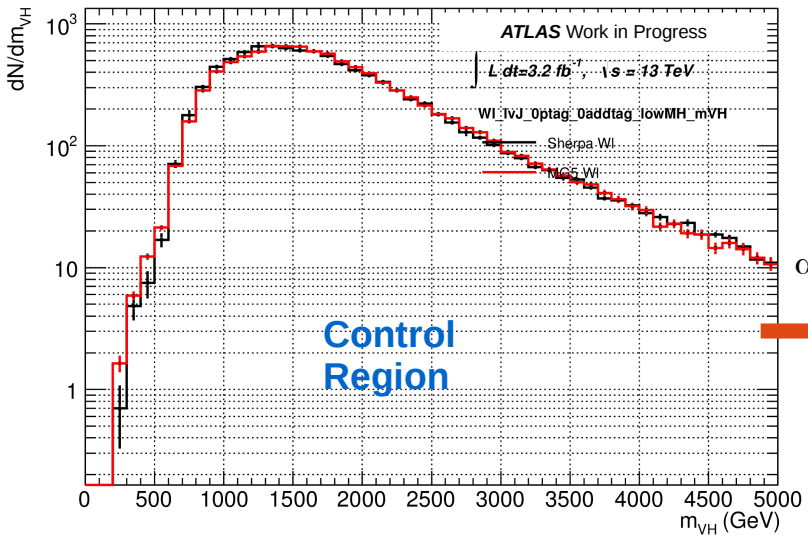

## Derivation Methodology:

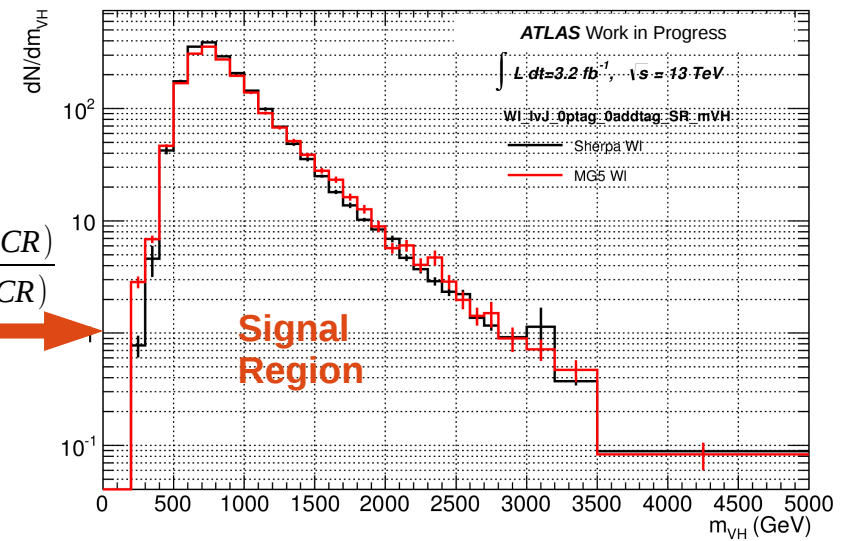

- 1) Calculate  $\alpha_{V+y} = \text{Sherpa}(V+y, \text{low}) / \text{MG5}(V+y, \text{low})$
- 2) Normalise MG5 & Sherpa to same area, and fit 1<sup>st</sup> order polynomial to ratio  
→ Shape variation only
- 3) Scale nominal SR V+Jets distribution by  $\alpha_{V+y}$
- 4) Fit polynomial to ratio:  
→ shape variation + yield extrapolation

Sherpa W+l ———

MG5 W+l ———

$$\alpha_{V+y} = \frac{N_{\text{Sherpa}}(CR)}{N_{\text{MG5}}(CR)}$$

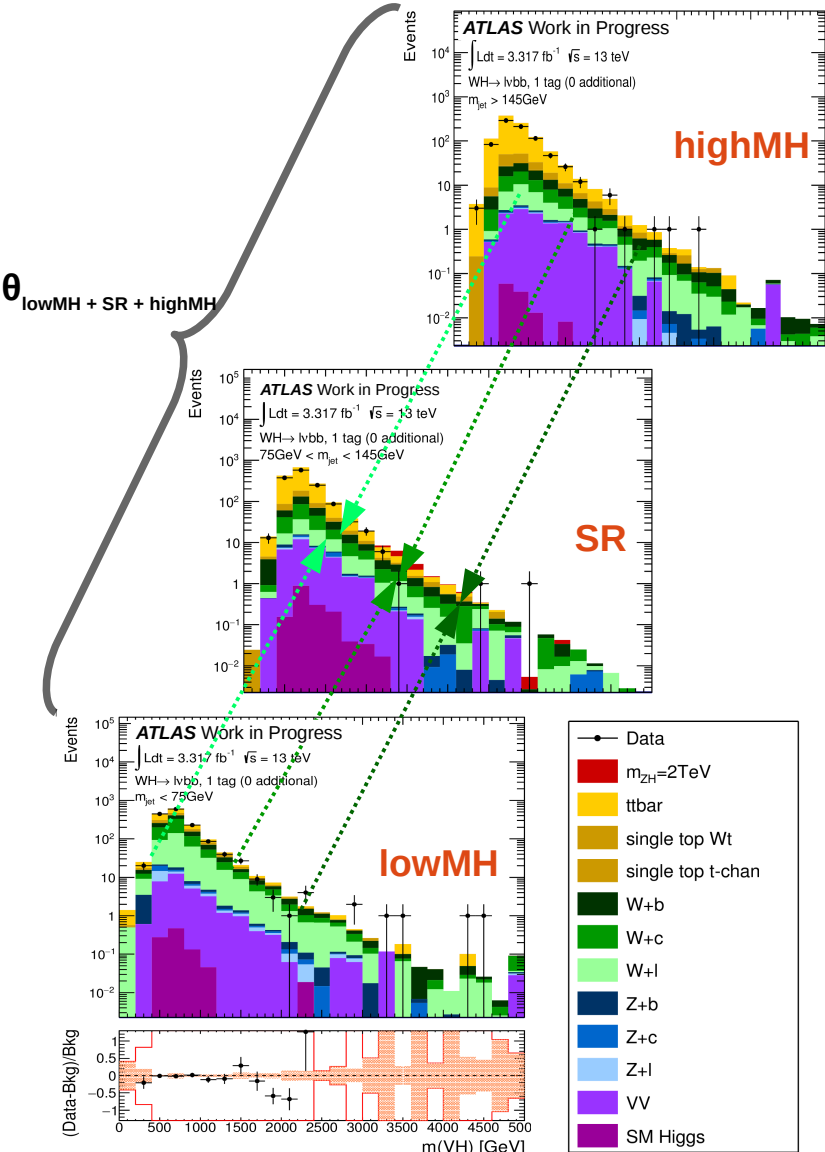

$$f_{V+y}^{\text{sys}}(x)$$

- (1) Overview
- (2) Event Topology & Selection
- (3) Search Strategy
- (4) V+Jets Background & Deriving a Systematic
- (5) Nuisance Parameters & Fit Handling**
- (6) Conclusion

# Nuisance Parameters & Fit Handling

Define a variation on the nominal ( $h^0$ )  $m_{VH}$  MC templates as:

$$h(x) = h^0(x) \pm \theta (h^{\pm var}(x) - h^0(x))$$

Where:  $\theta$  = NP controlling a systematic variation on  $m_{VH}$ .

The variation  $h^{var}$  is derived by re-weighting the nominal histogram  $h^0$  by the MadGraph/Sherpa ratio:

$$h_{V+y}^{\pm var}(x) = f_{V+y}^{syst}(x) \times h_{V+y}^0(x)$$

$y$  = flavour

$$\left. \begin{aligned} h_{V+b}^{post}(x) &= h_{V+b}^0(x) \pm \theta (h_{V+b}^{\pm var}(x) - h_{V+b}^0(x)) \\ h_{V+c}^{post}(x) &= h_{V+c}^0(x) \pm \theta (h_{V+c}^{\pm var}(x) - h_{V+c}^0(x)) \\ h_{V+l}^{post}(x) &= h_{V+l}^0(x) \pm \theta (h_{V+l}^{\pm var}(x) - h_{V+l}^0(x)) \end{aligned} \right\} \text{lowMH}$$
  

$$\left. \begin{aligned} \dots \\ \dots \\ \dots \end{aligned} \right\} \text{SR \& highMH}$$

- (1) Overview
- (2) Event Topology & Selection
- (3) Search Strategy
- (4) V+Jets Background & Deriving a Systematic
- (5) Nuisance Parameters & Fit Handling**
- (6) Conclusion

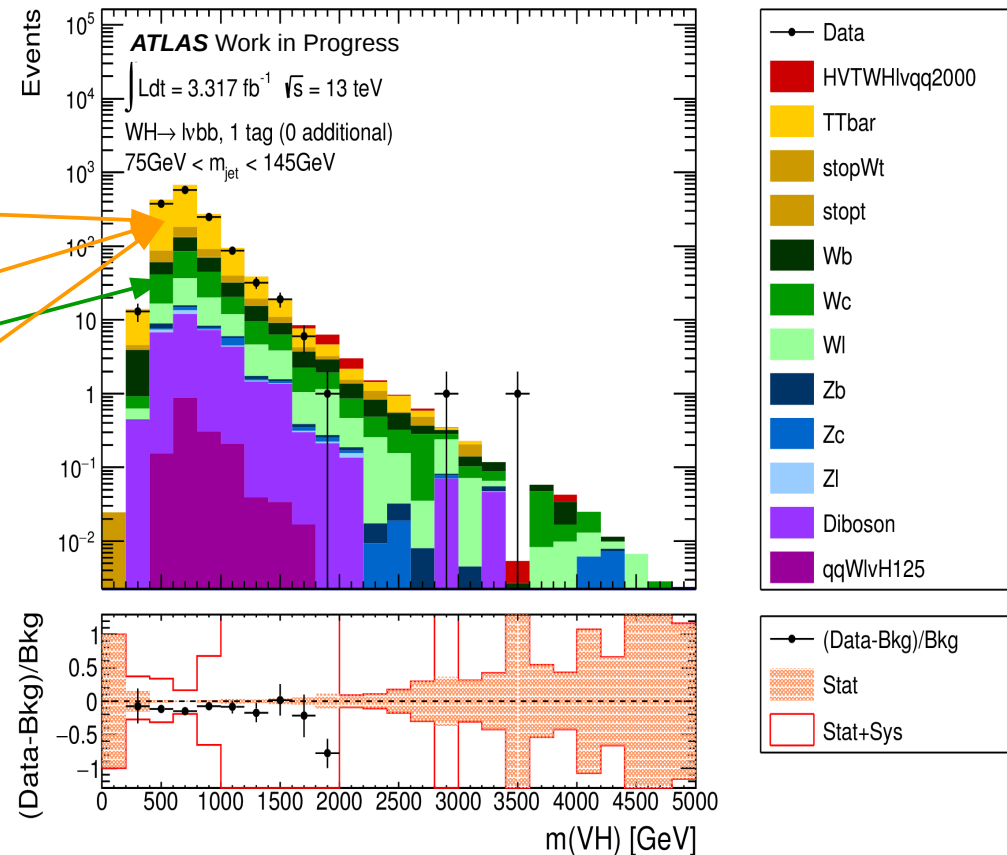

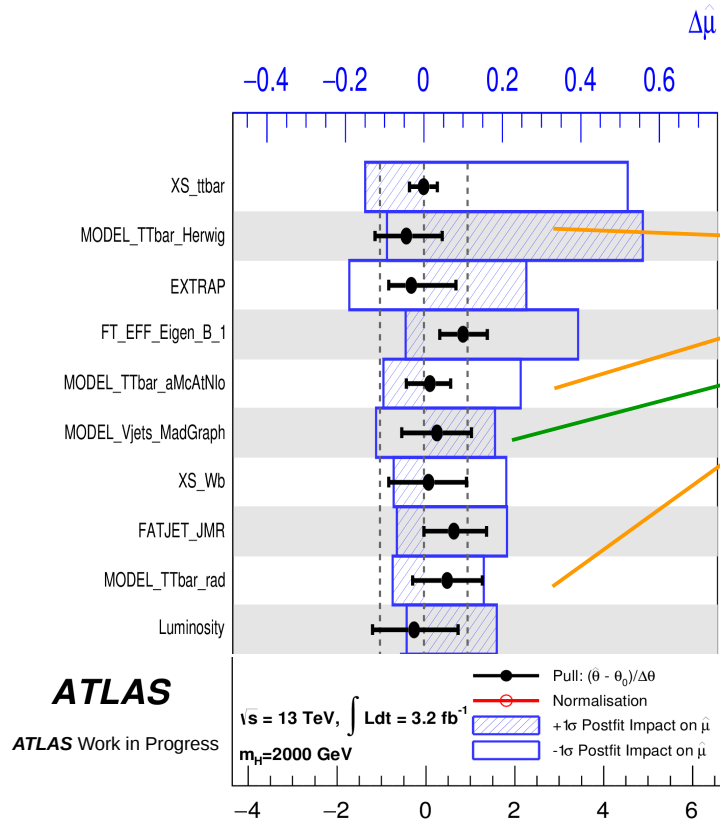

# Nuisance Parameters & Fit Handling

→ Following fit procedure, the best fit results for the NP's can be summarised in 2 ways:

**Ranking Plot**: Quantifies the impact of a  $\pm 1\sigma$  variation in each NP on the best fit signal strength parameter

→ Ranking plot shows that in the 1-lepton channel, the **V+Jets** bkg is 6<sup>th</sup> most dominant systematic.

# Conclusion

- Search using a Phenomenological Lagrangian for Heavy Vector Resonances.
- Boosted topologies resulting from heavy resonances:  $500\text{GeV} < m_{V'} < 5\text{TeV}$
- Substructure techniques open boosted topologies for investigation.
- $H \rightarrow bb$  viable at high  $m_{VH}$  as backgrounds fall off
  - Possible reach due to substructure.
- V+Jets & TTbar bkg dominate
  - Derive systematic from MC modeling differences
- Run 1  $\sim 20 \text{ fb}^{-1}$ , Run 2  $\sim 3.2\text{fb}^{-1}$  – A competitive result already obtained

# Overview

→ A theoretical paradigm is used called the “Heavy Vector Triplet” Model.

→  $SU(2)_L$  iso-triplet of fields:  $W^{\pm}, Z^0$

→ “Simplified Strategy” Model, a simplified Lagrangian that retains the relevant mass & coupling parameters.

→ Limits can then be derived on “ $\sigma \times BR$ ”

→ Likelihood Function ‘ $L$ ’ in terms of phenomenological parameters  $\vec{c}$

→ Relate  $\vec{c}$  to  $\vec{p}$  (explicit model parameters) to extract limits on the explicit parameters of a given theoretical model.

## 2 Benchmark Models:

→ Benchmark A:

Weakly coupled vector resonances from extension of SM gauge group.

$$g_V = 1$$

**Fermion & Vector Boson couplings equivalent**

→ Benchmark B:

Strongly coupled scenario,

$$g_V = 3$$

**Suppressed fermionic couplings.**

**SM Vector Boson Coupling**

$$i g_V c_H V_\mu^a H^\dagger \tau^a \vec{D}^\mu H$$

**SM Fermion Coupling**

$$\frac{g^2}{g_V} c_F V_\mu^a J_F^{\mu a}$$

$$c_F \rightarrow \{c_l, c_q, c_3\}$$

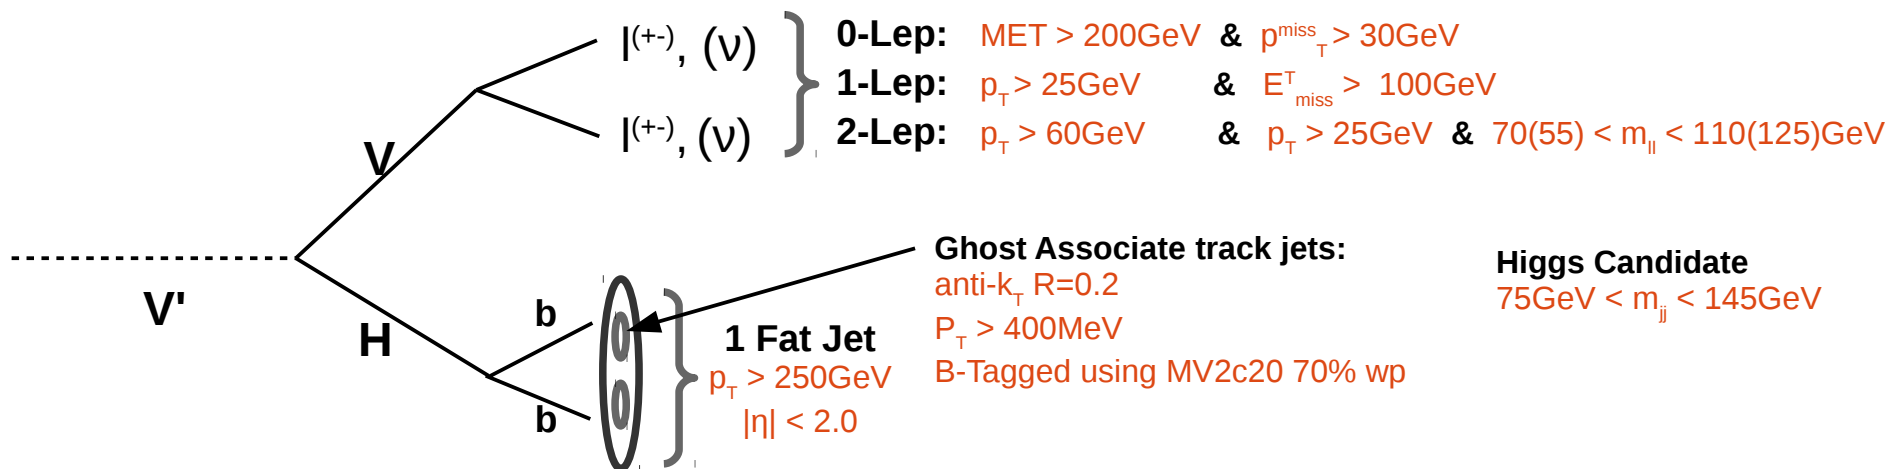

# Event Topology & Selection

→ Searching for  $m_{VH}$  system  $> 1.5$  TeV will result in boosted topologies.

- (5) Nuisance Parameters & Fit Handling**
- (6) Results
- (7) Conclusion

# Nuisance Parameters & Fit Handling

$\theta_{\text{lowMH} + \text{SR} + \text{highMH}}$

Perform a Maximum Likelihood fit (ML) to the  $m_{\text{VH}}$  spectrum:

$$L(\mu_b, \mu_s) = \prod_{i=1}^{N_{\text{chan}}} \prod_{j=1}^{N_{\text{bin}}} [P(N_{ij} | \mu_s(\vec{\theta}))_{ij} + \sum_{k=1}^{N_{\text{bkg}}} b(\vec{\theta}_{ijk})] \times \prod_{n=1}^{N_g} N(\hat{\theta} | \theta)$$

Where  $\theta$  represent the NP controlling a systematic variation on  $m_{\text{VH}}$ .

Define a variation on the  $m_{\text{VH}}$  MC templates as:

$$h(x) = h^0(x) \pm \theta (h^{\pm \text{var}}(x) - h^0(x))$$

The variation  $h^{\text{var}}$  is derived by re-weighting the nominal histogram  $h^0$  via the systematic difference between MadGraph & Sherpa:

$$h_{V+y}^{\pm \text{var}}(x) = f_{V+y}^{\text{sys}}(x) \times h_{V+y}^0(x)$$

And  $h^0_{V+y}$  is the nominal MC template (histogram),  $y$  is the flavour of the event

One NP for all mass regions & all V+Jet flavours:  $\theta = \theta_{V+b | \text{lowMH}}, \theta_{V+c | \text{lowMH}}, \dots, \theta_{V+b | \text{SR}}$

$$\left. \begin{aligned} h_{V+b}^{\text{post}}(x) &= h_{V+b}^0(x) \pm \theta (h_{V+b}^{\pm \text{var}}(x) - h_{V+b}^0(x)) \\ h_{V+c}^{\text{post}}(x) &= h_{V+c}^0(x) \pm \theta (h_{V+c}^{\pm \text{var}}(x) - h_{V+c}^0(x)) \\ h_{V+l}^{\text{post}}(x) &= h_{V+l}^0(x) \pm \theta (h_{V+l}^{\pm \text{var}}(x) - h_{V+l}^0(x)) \end{aligned} \right\} \text{lowMH}$$
  

$$\left. \begin{aligned} \dots \\ \dots \\ \dots \end{aligned} \right\} \text{SR \& highMH}$$
