Mass and Thermodynamic Relations for Lifshitz Symmetric Black Holes

Tuesday 17 June 2014 10:00 (15 minutes)

The definition of a meaningful thermodynamic mass (appearing in the first law and the Smarr relation, when a cosmological constant is taken into account) is a difficult concept in Lifshitz symmetric spacetimes, due in part to the boundary conditions that need to be satisfied. Knowing such a mass opens up opportunities for examining the critical behaviour of these black holes which is interesting in a gauge/gravity context.

Here we discuss our attempts at formulating a mass for some exact Lifshitz symmetric black hole solutions.
