Big Thanks To Everyone At DEAP-3600!

That's Me!

Introduction to DEAP-3600 and Machine Learning

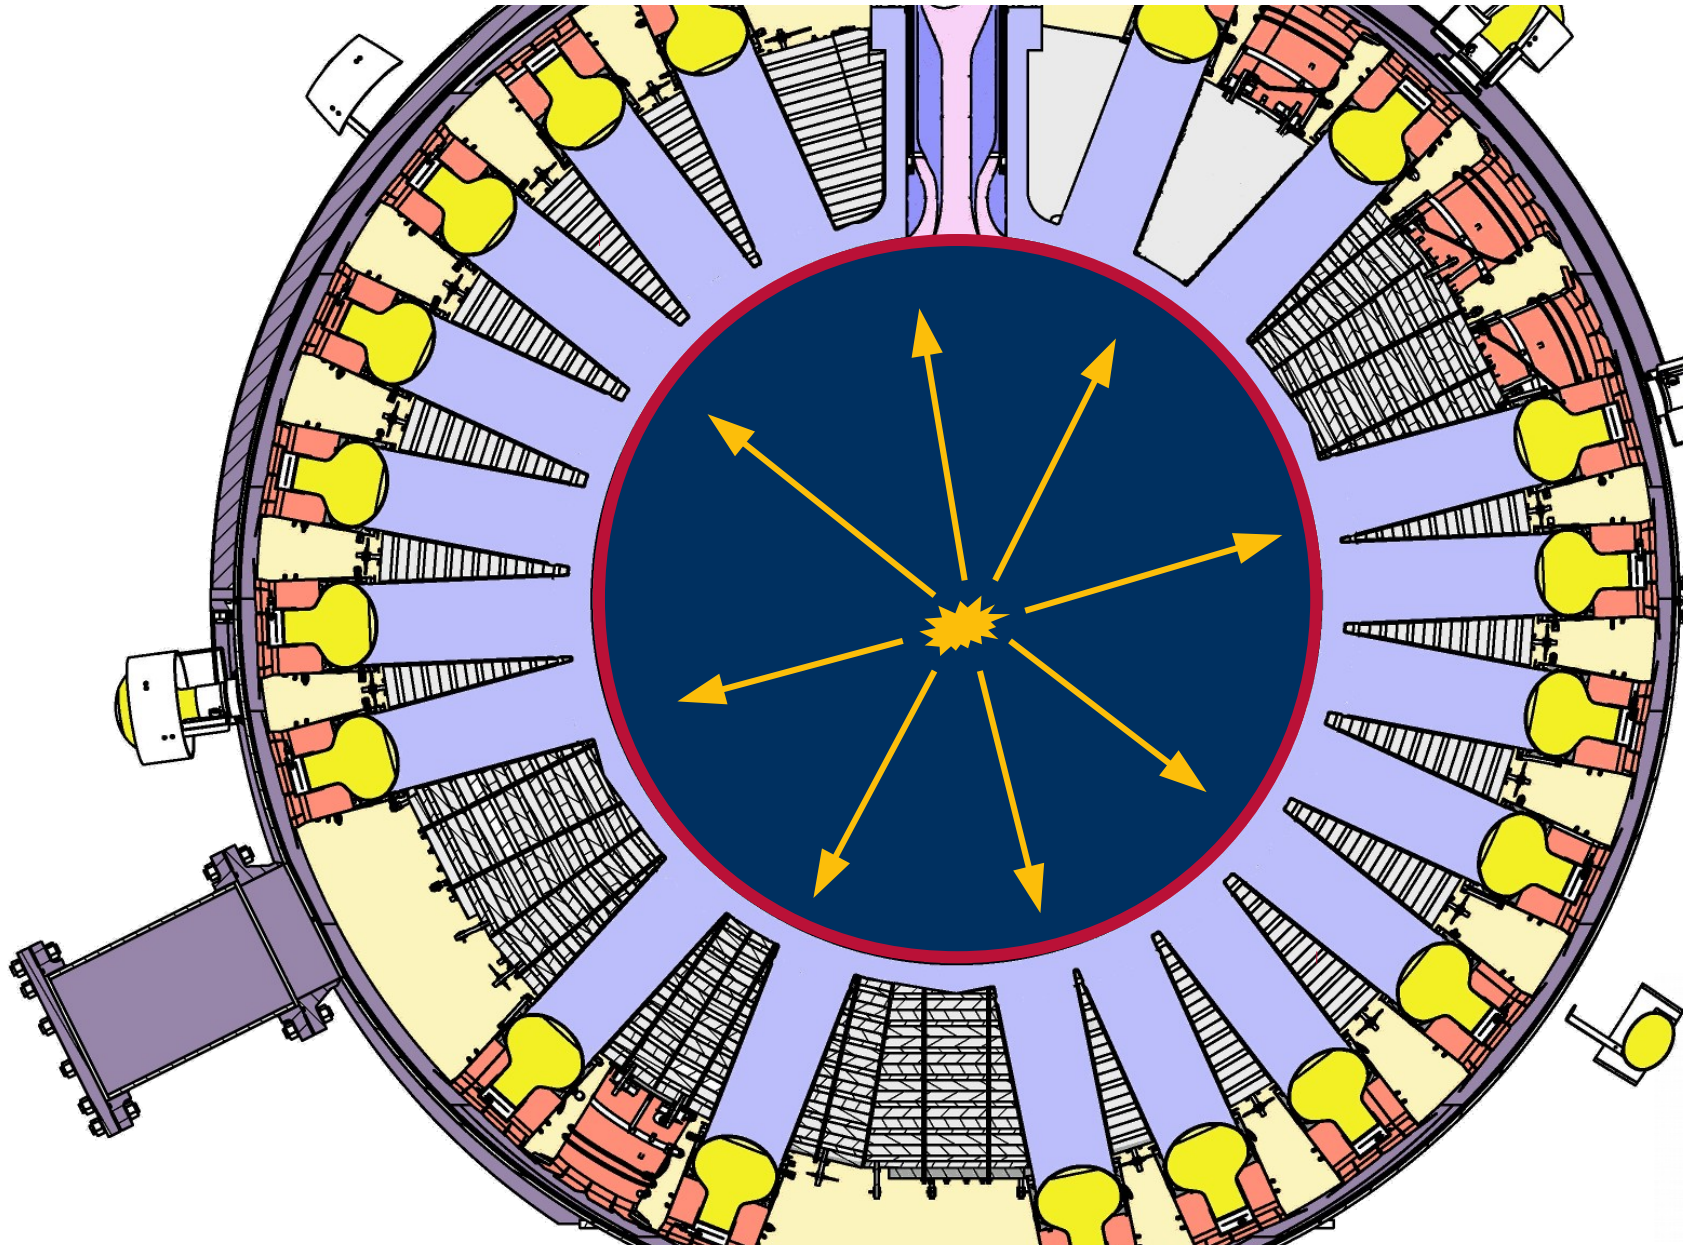

**Using Machine Learning to improve the
Dark Matter discovery potential**

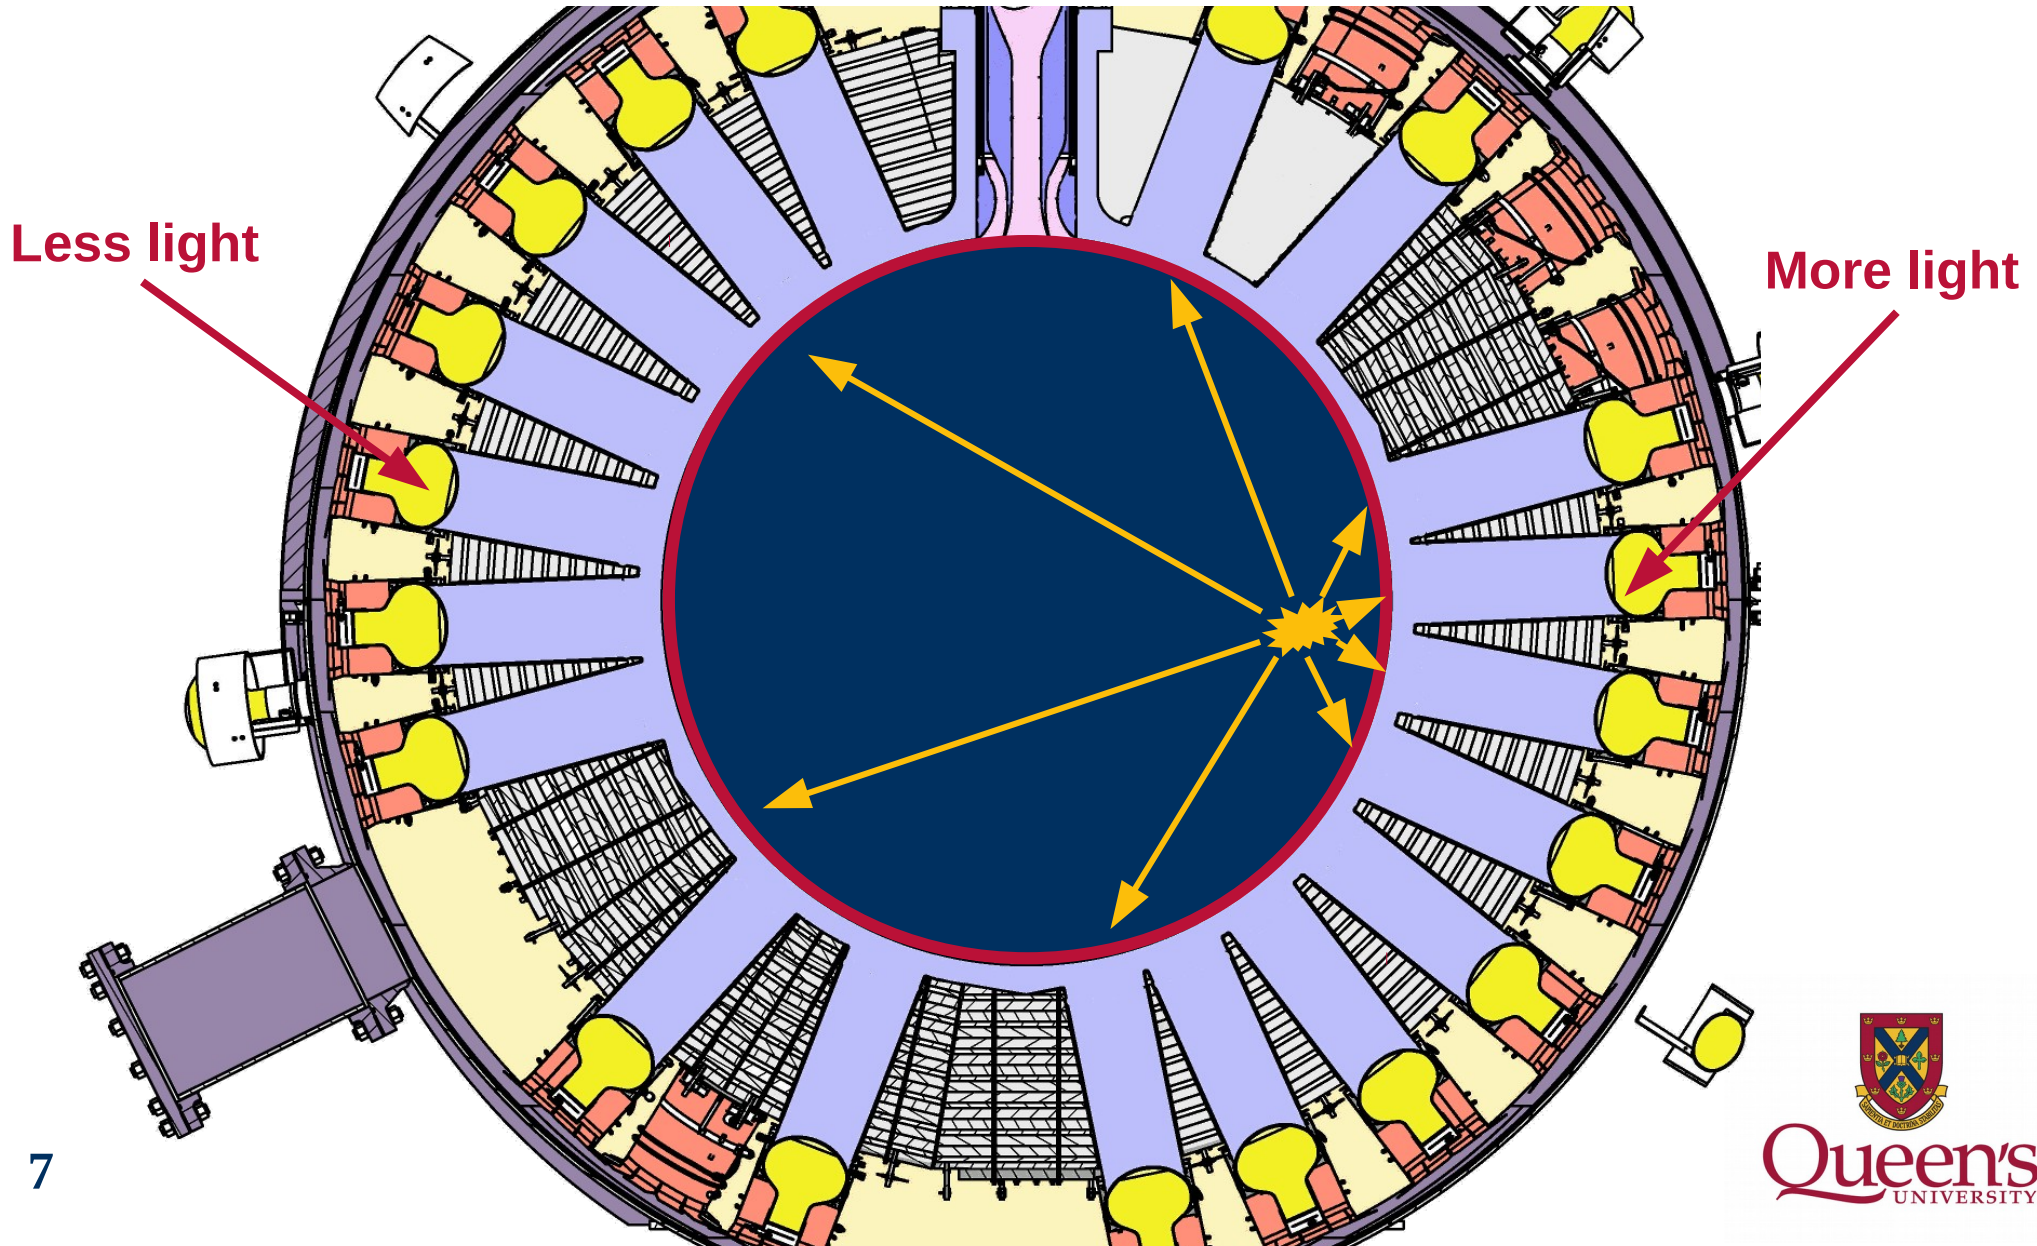

Validating the event classification

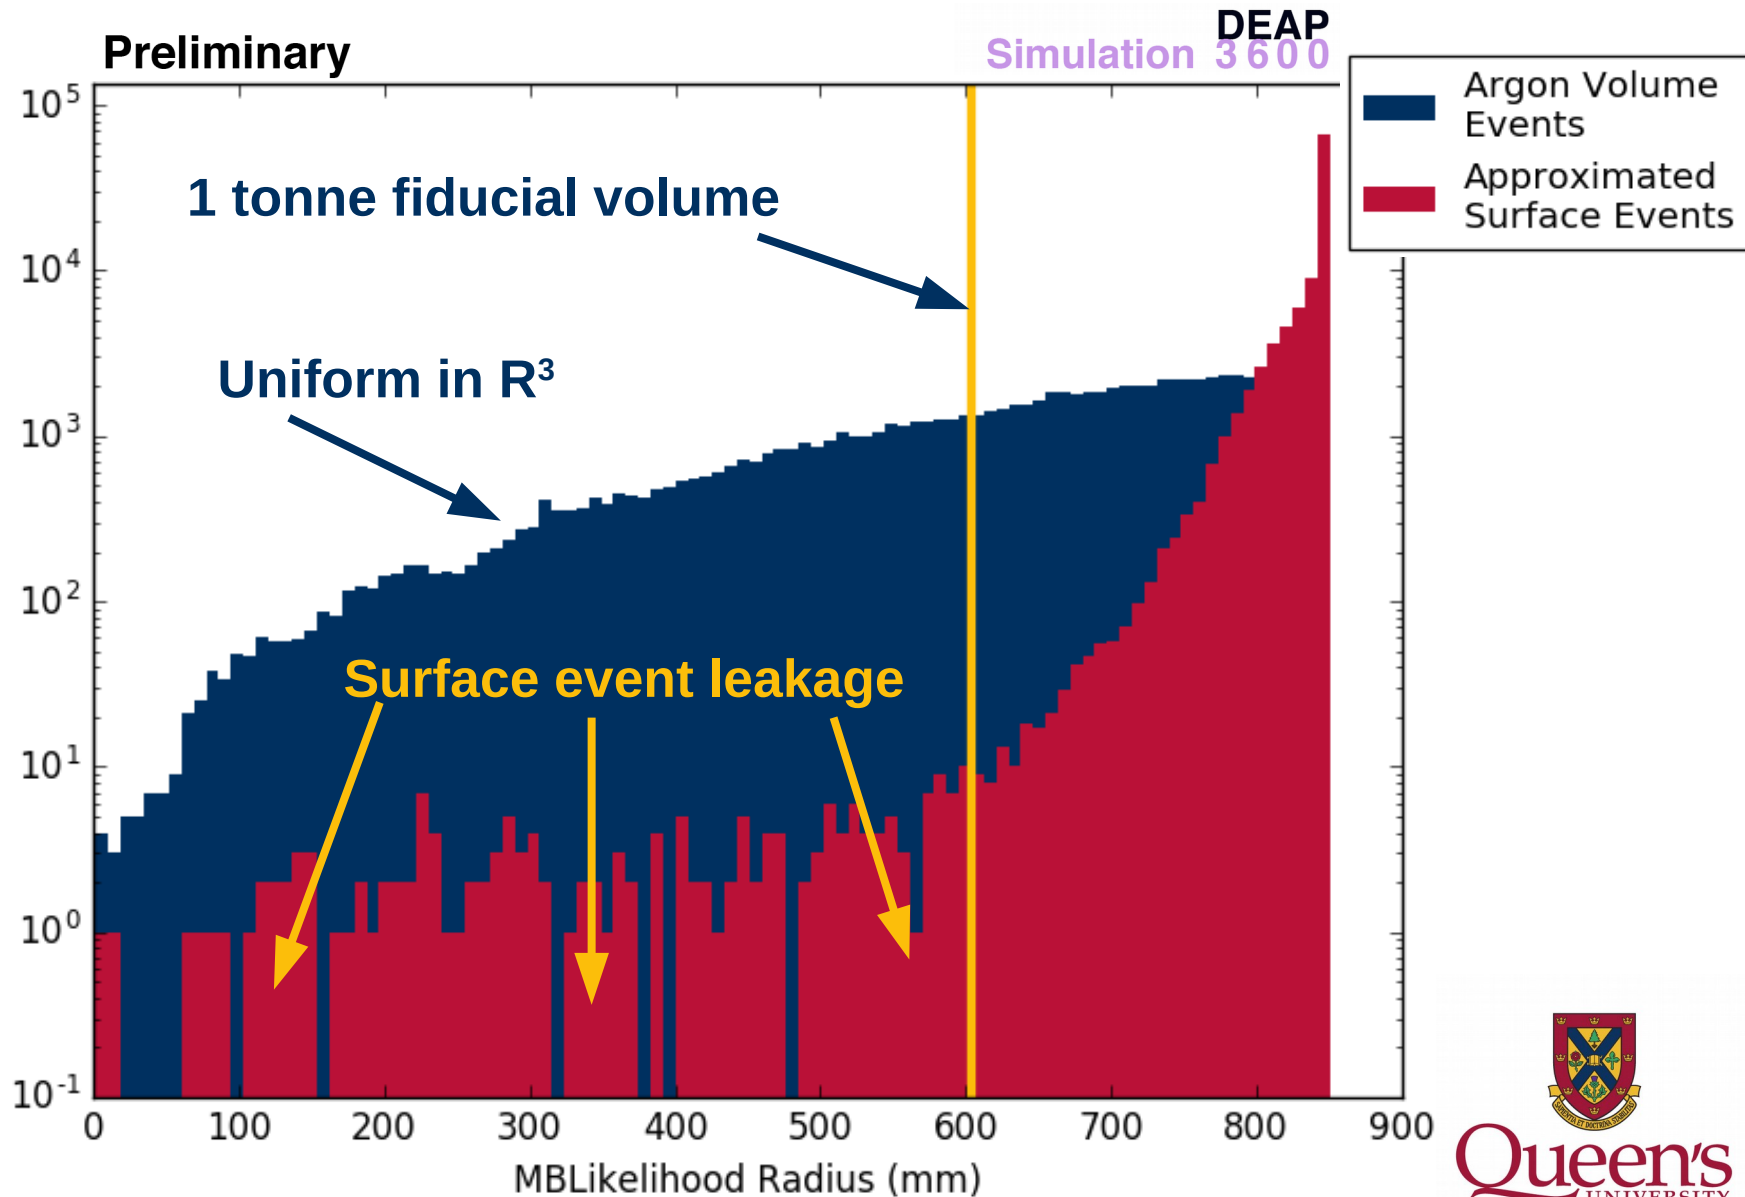

Position reconstruction can be achieved using relative PMT charges

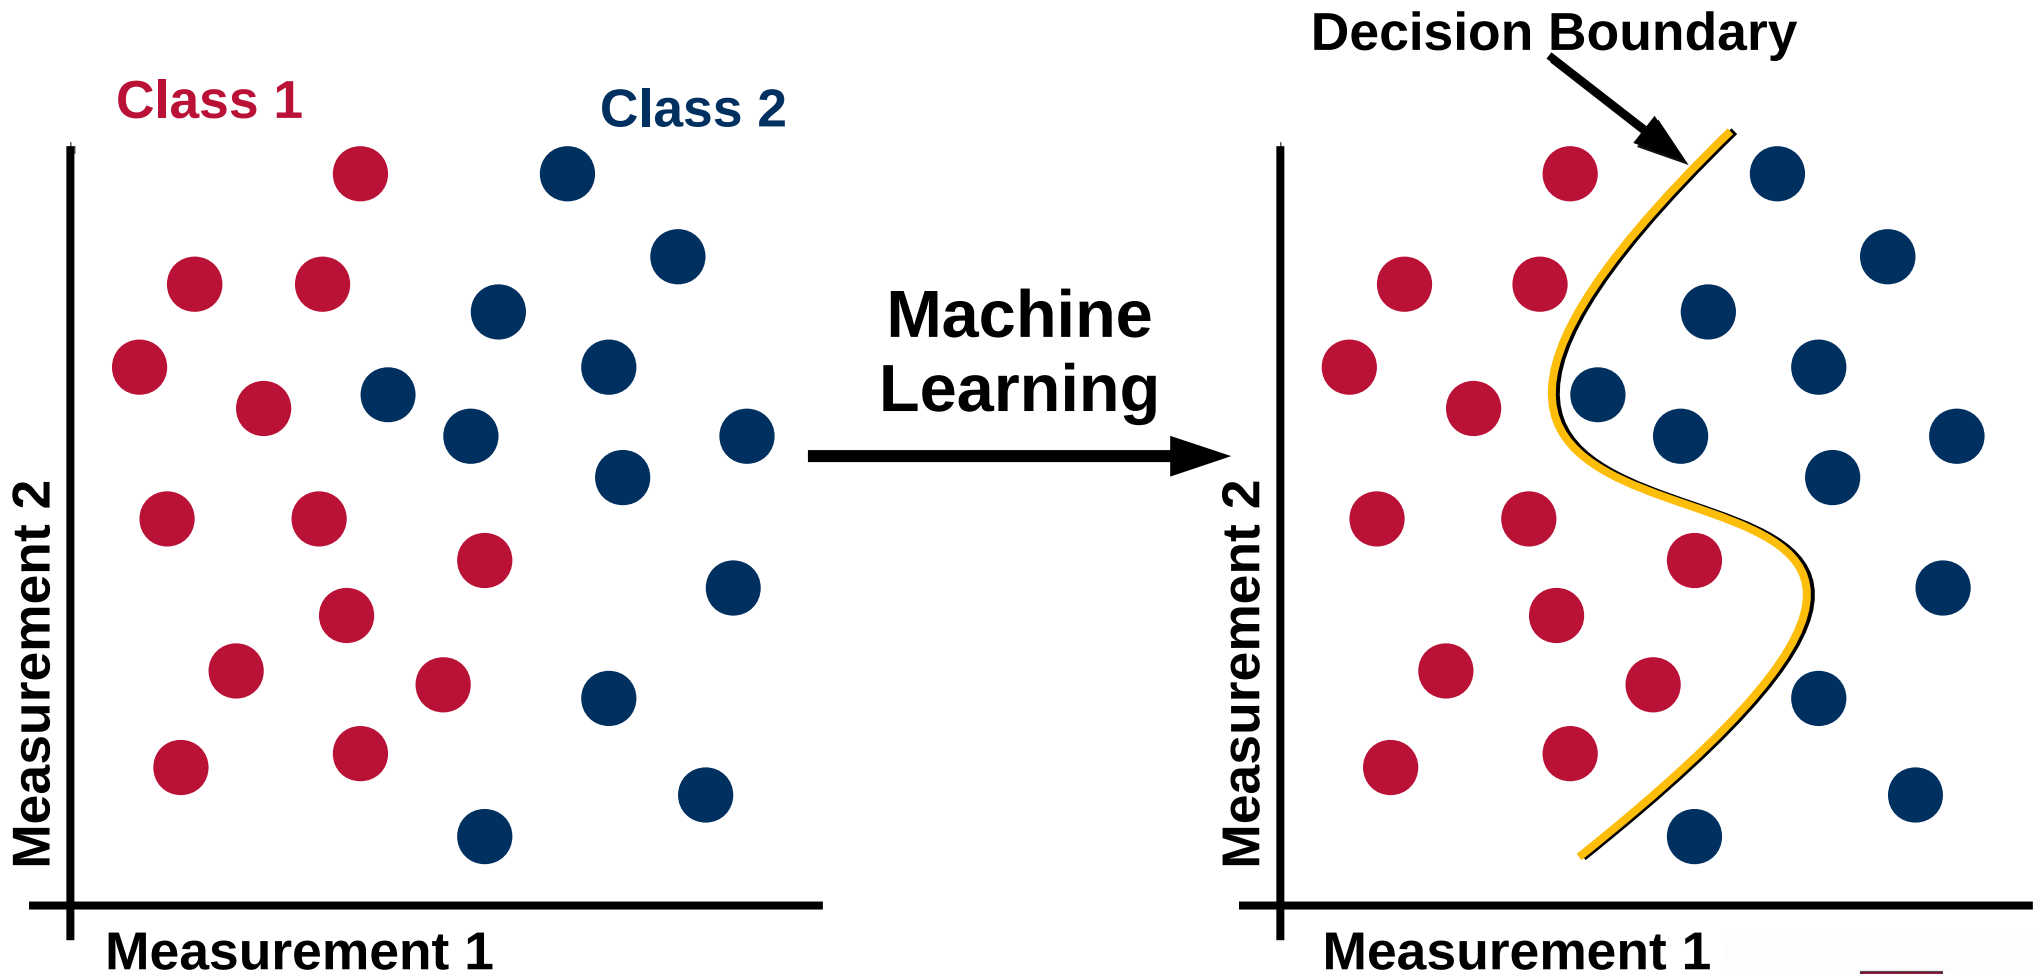

Position reconstruction can be achieved using relative PMT charges

The MBLikelihood algorithm does a good job of creating a fiducial volume

Machine Learning is well poised to assist in creating a fiducial volume

Logistic Regression (LR)

Linear Support Vector Machine (LSVM)

Naive Bayes (NB)

K-Nearest Neighbors (KNN)

Support Vector Machine (SVM)

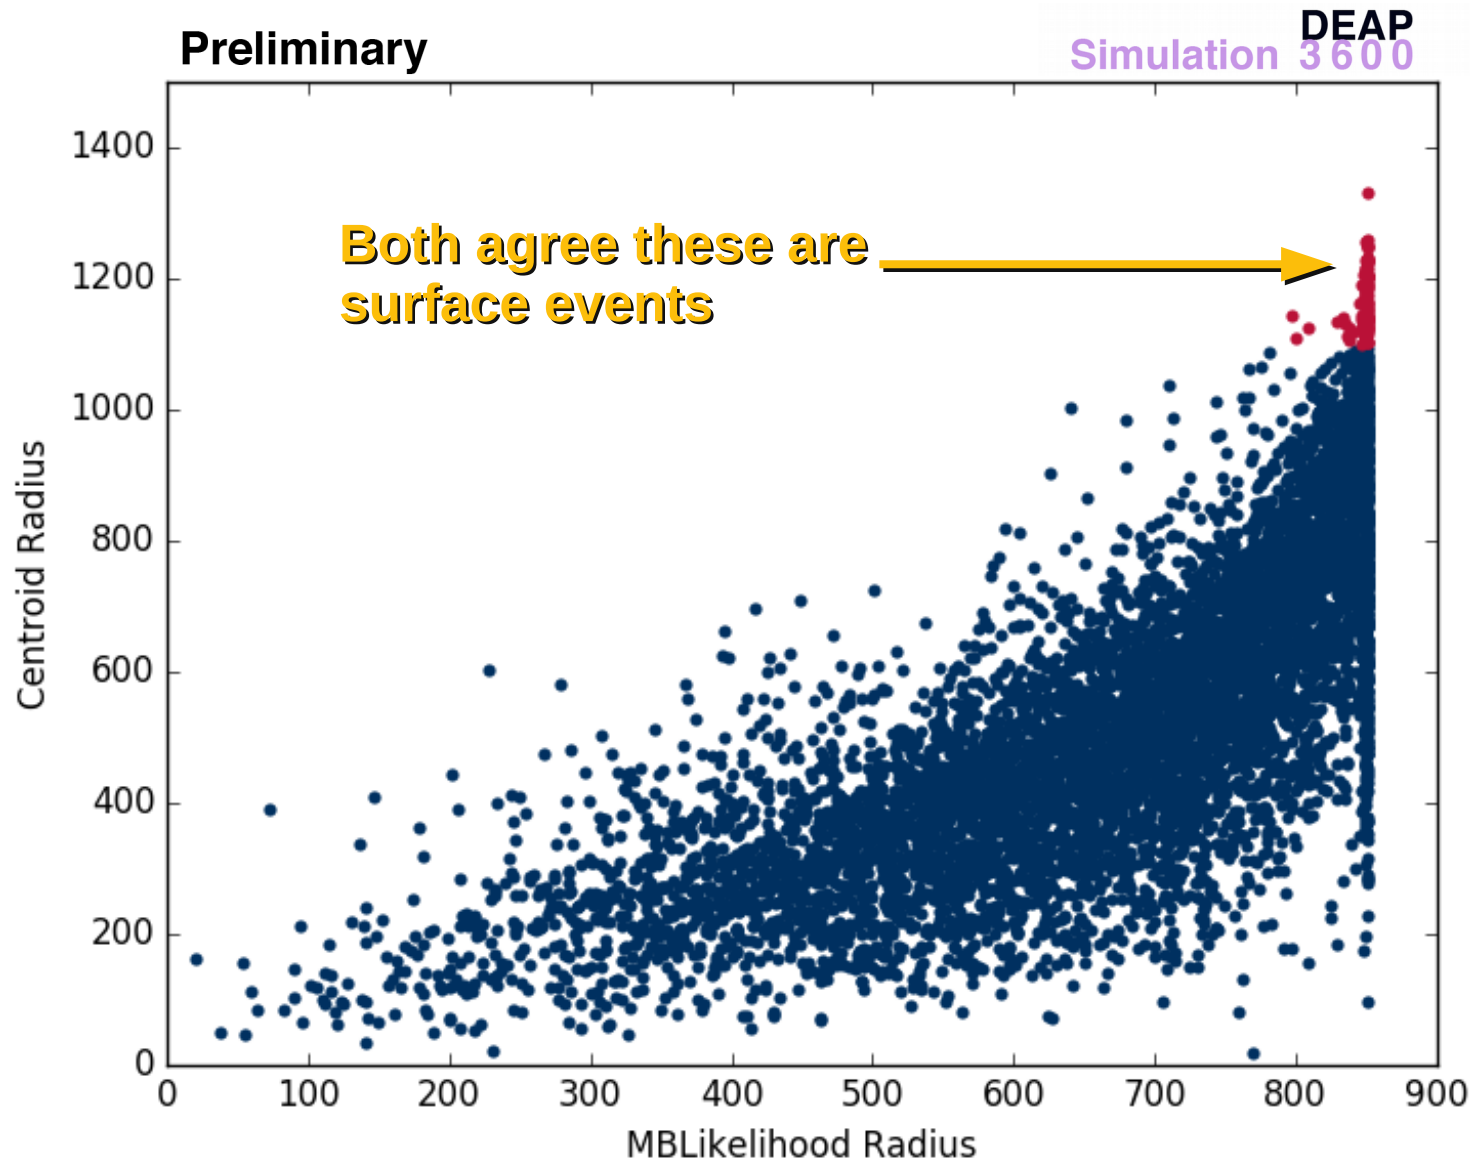

Neural Network (NN)

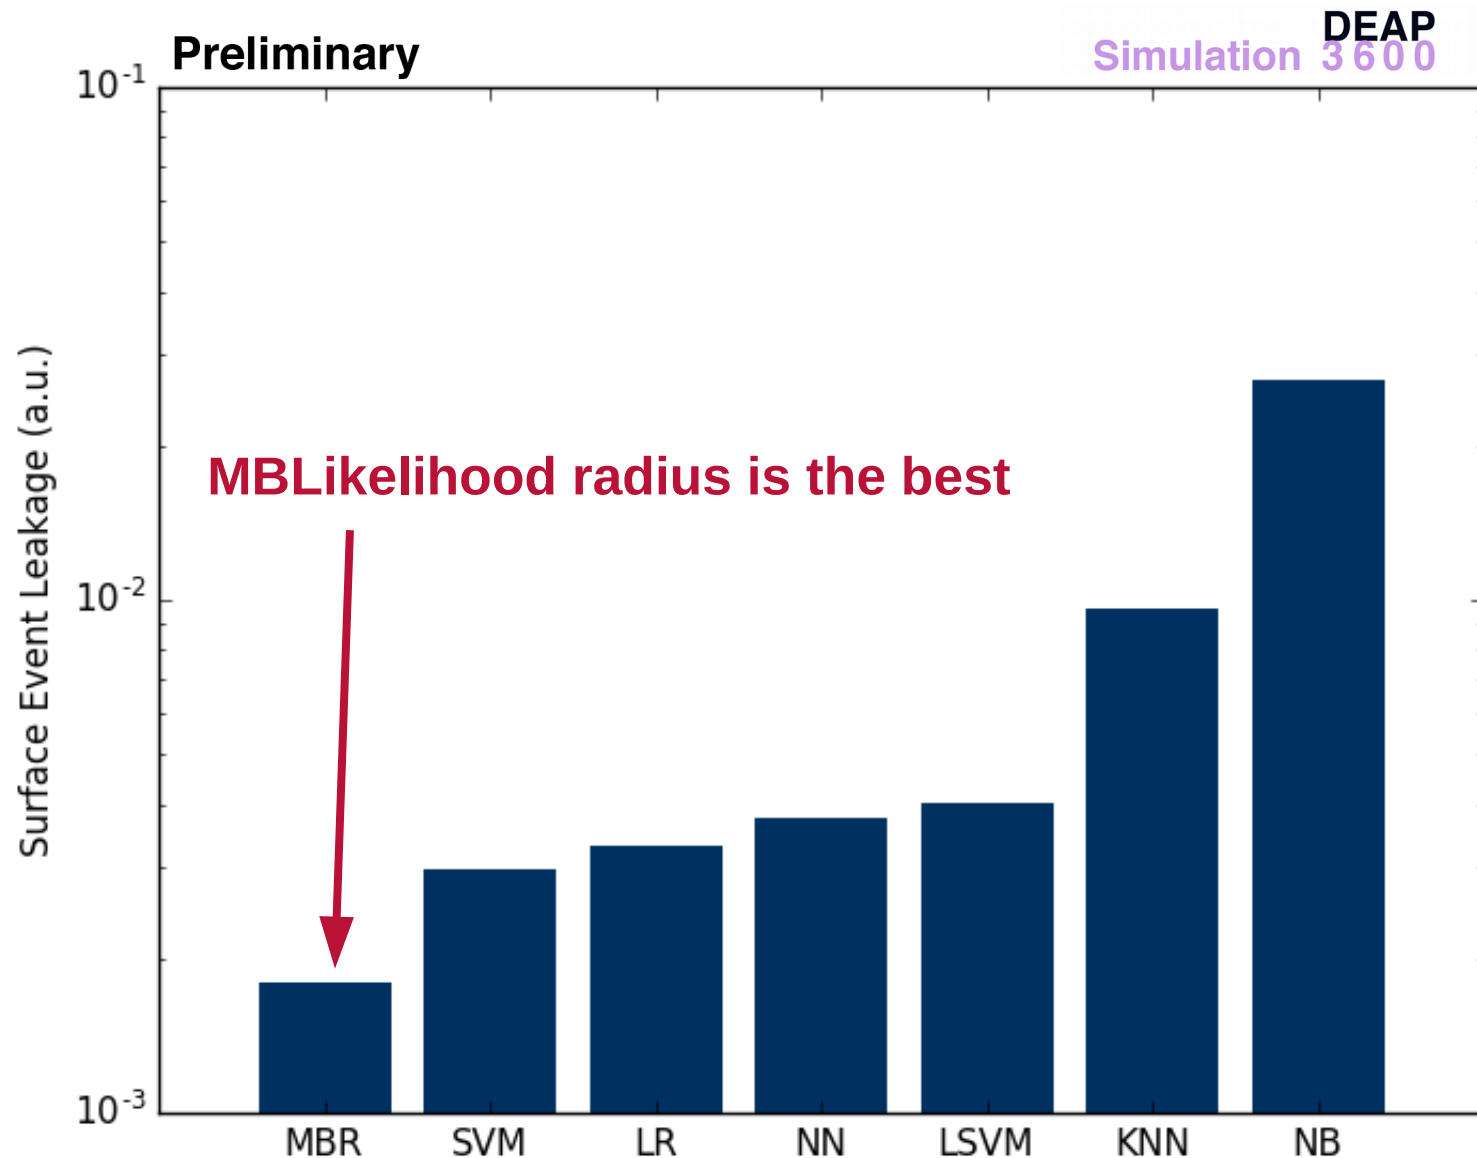

Using Machine Learning to improve the Dark Matter discovery potential

Training data can be taken from the real detector for Machine Learning, but not for MBLikelihood

Some Machine Learning algorithms perform well, but don't beat MBLikelihood

MBLikelihood and Machine Learning algorithms can be combined (Boosted)

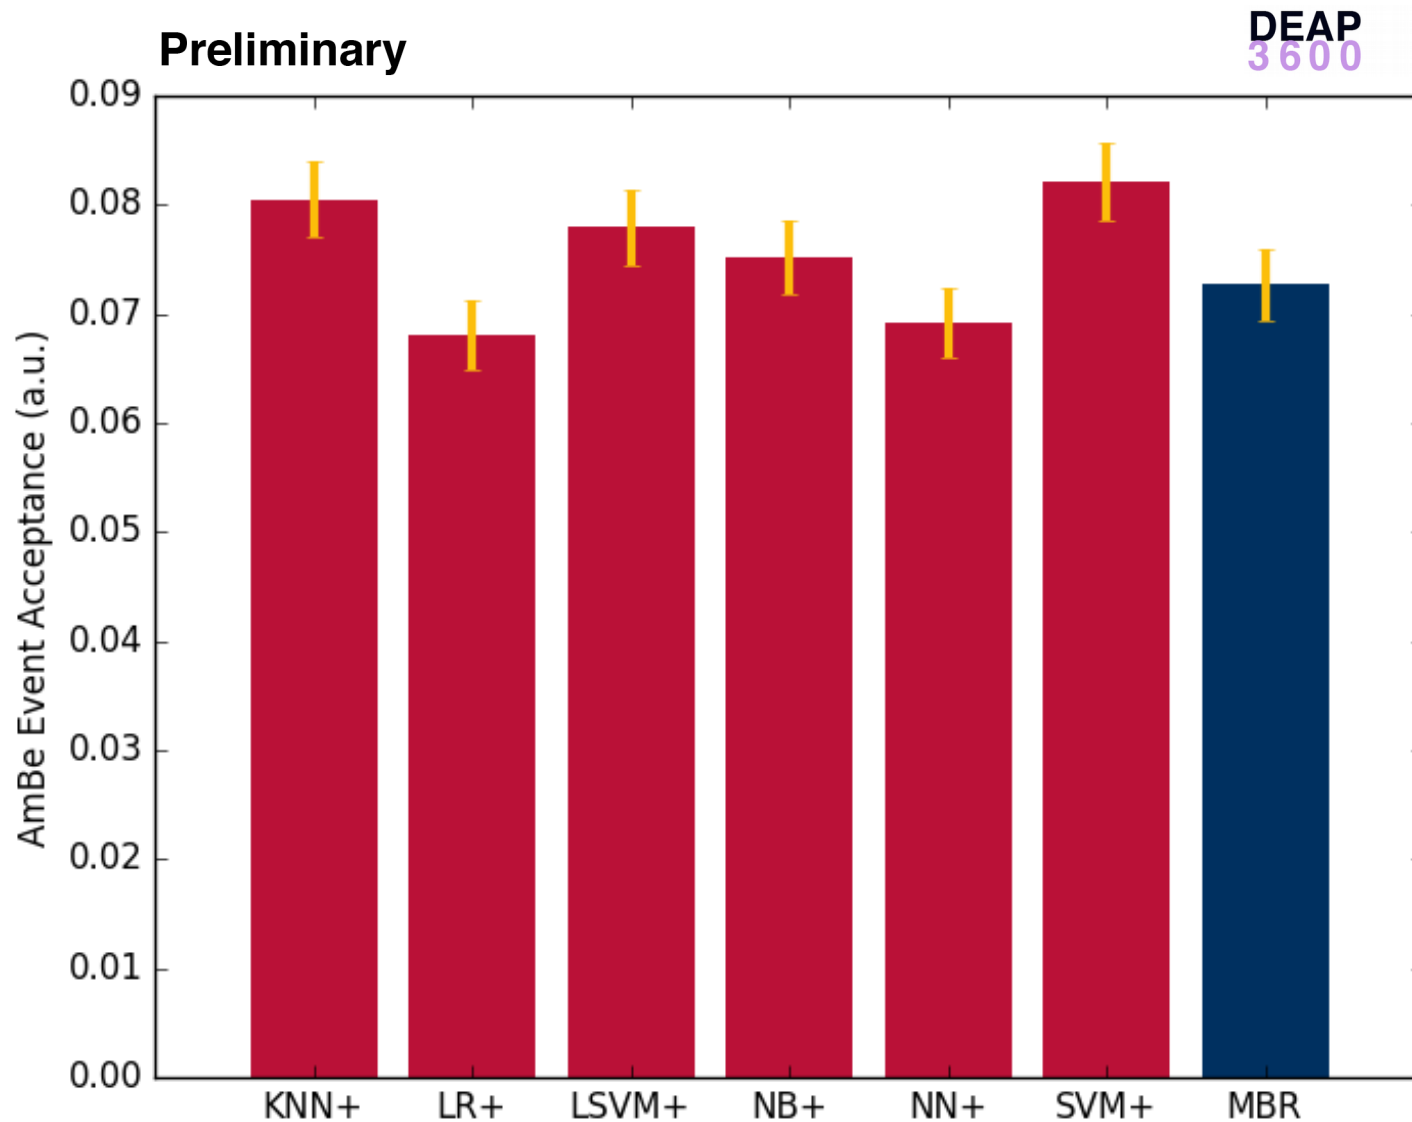

The boosted analysis has reduced surface event leakage

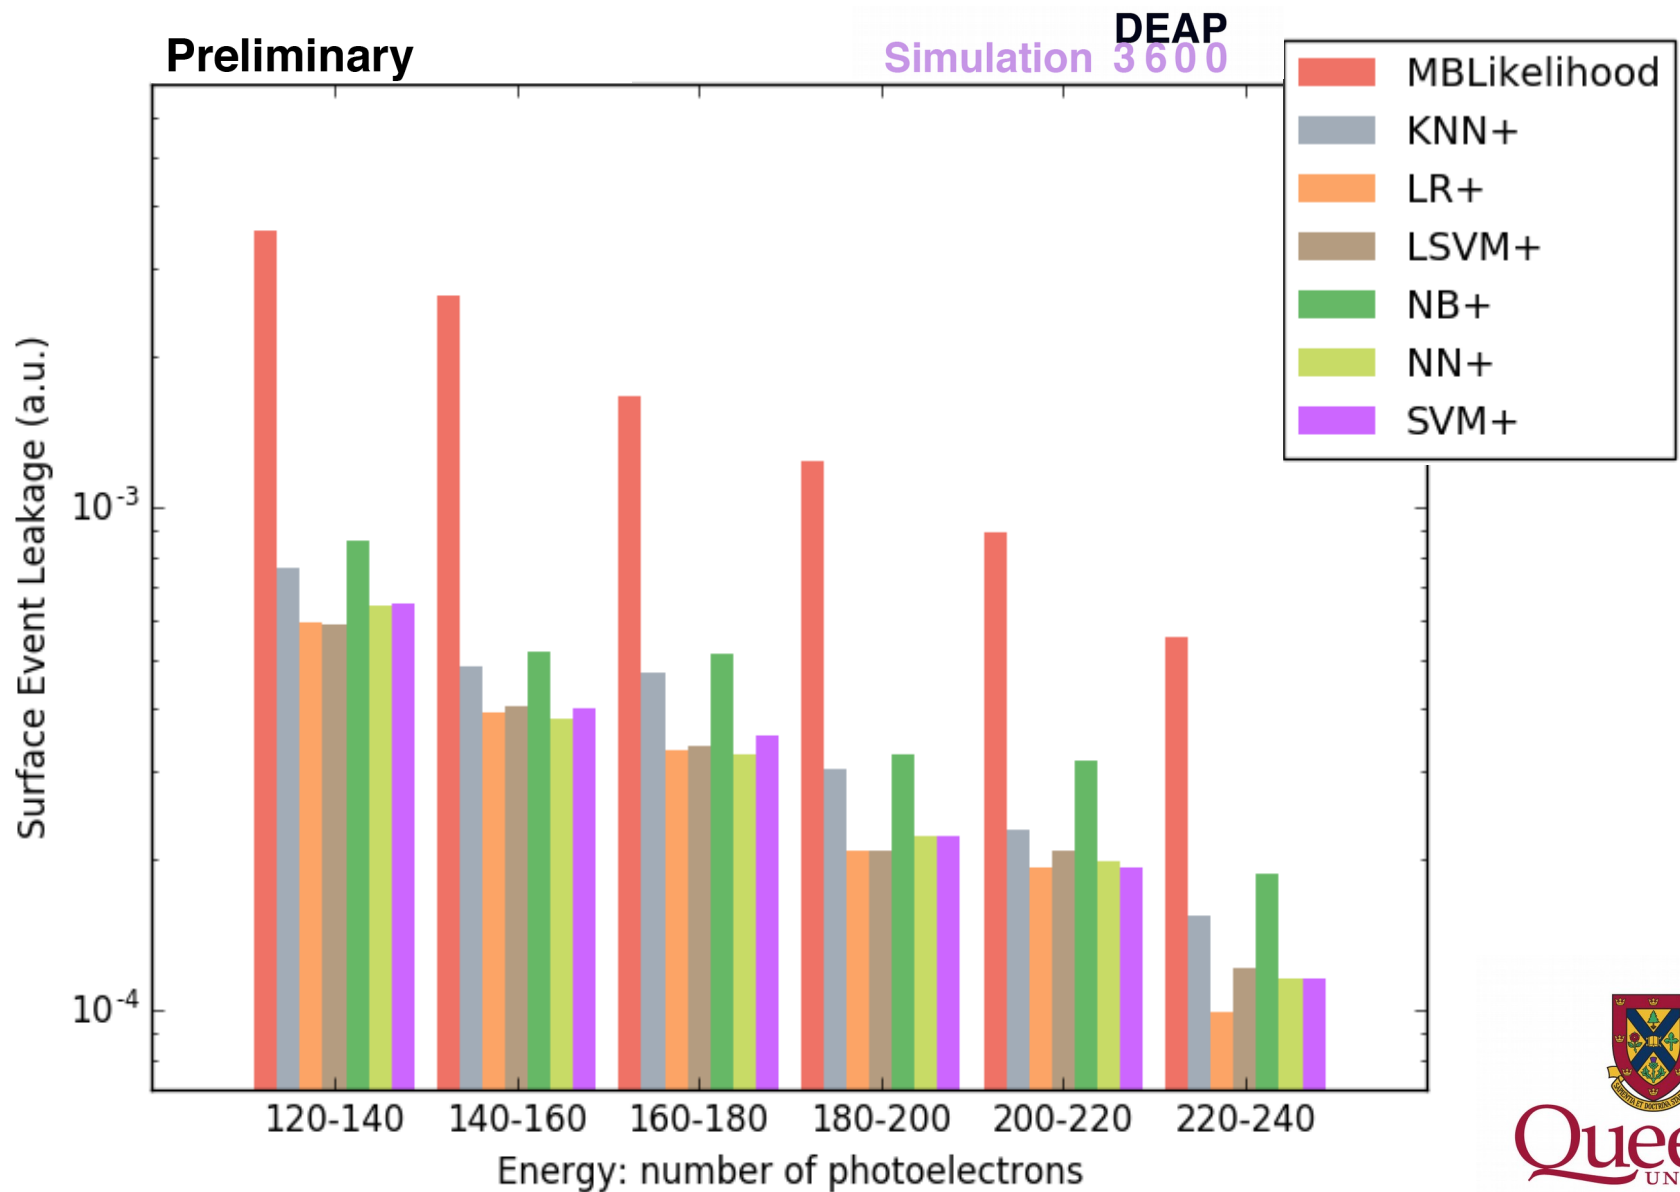

Validating the event classification

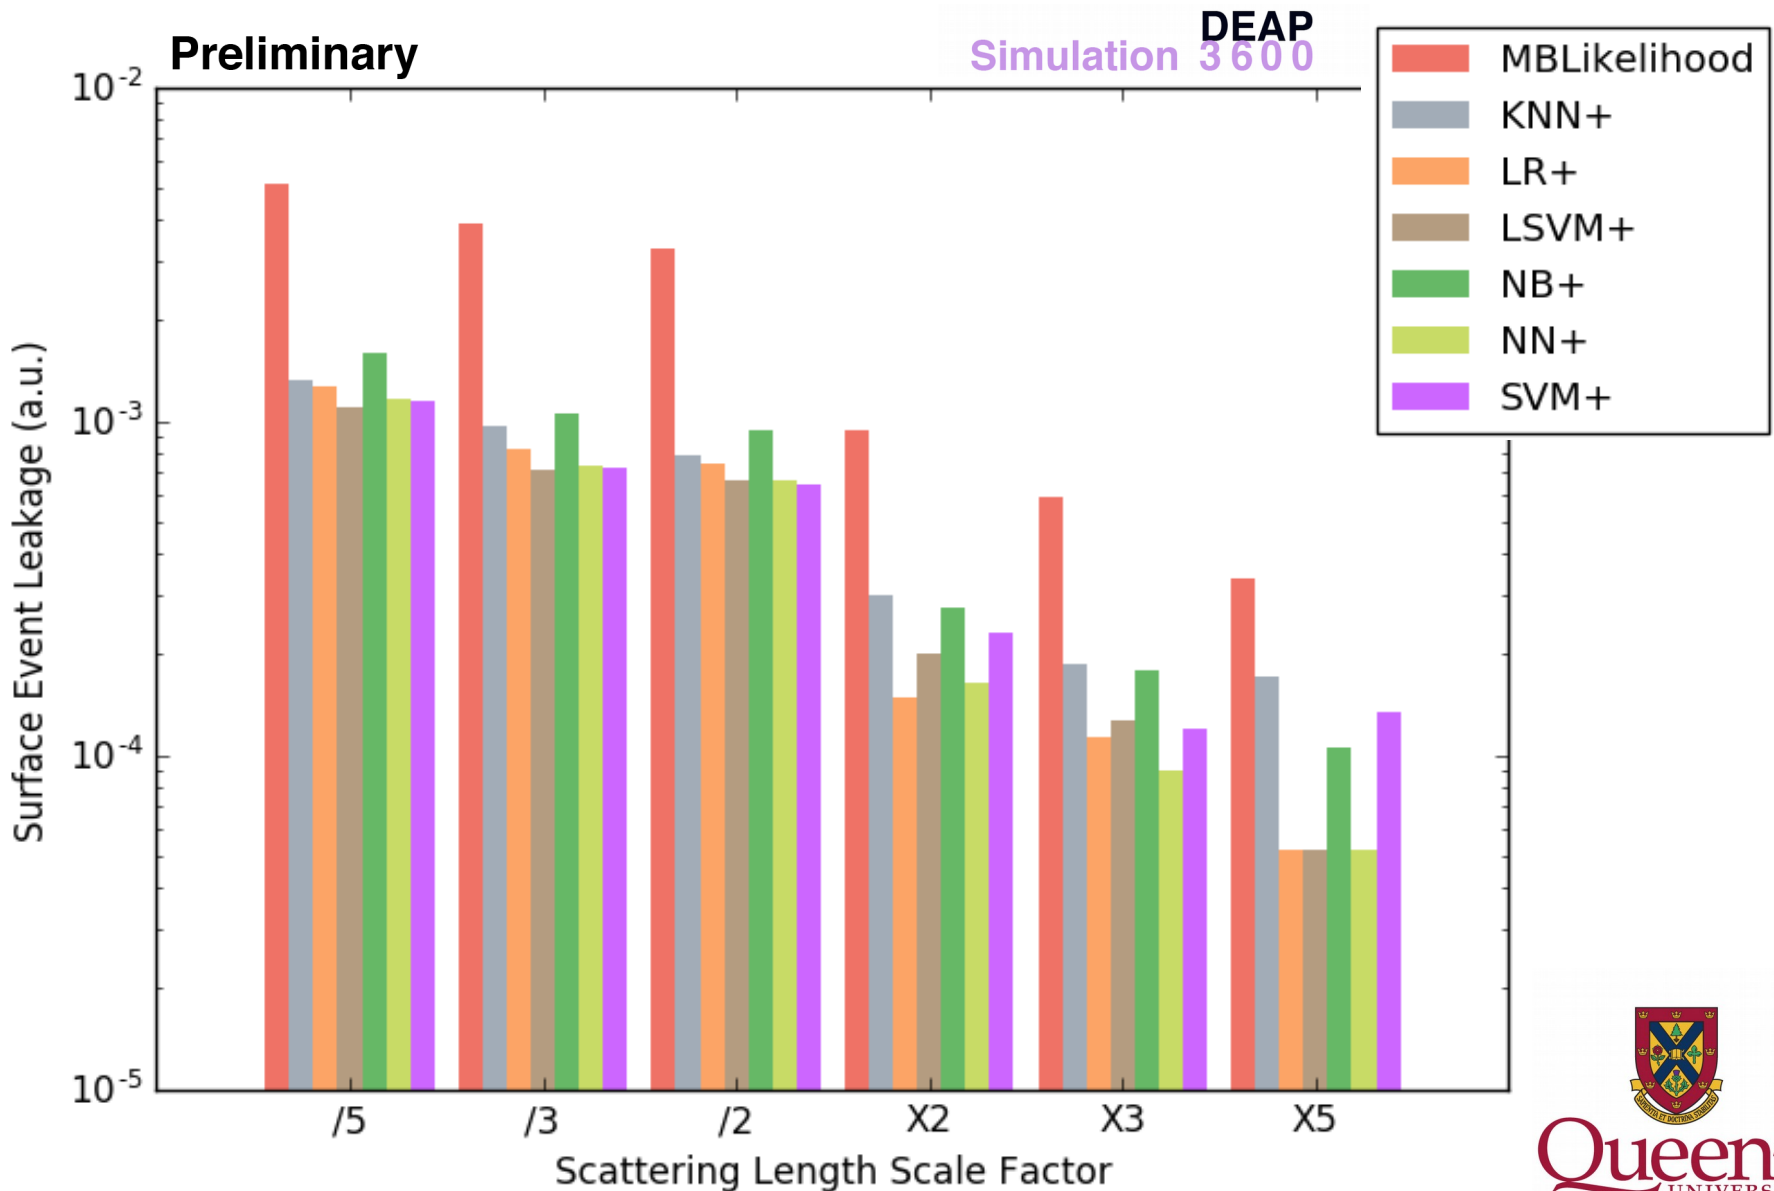

The boosted analysis behaves well on real neutron data

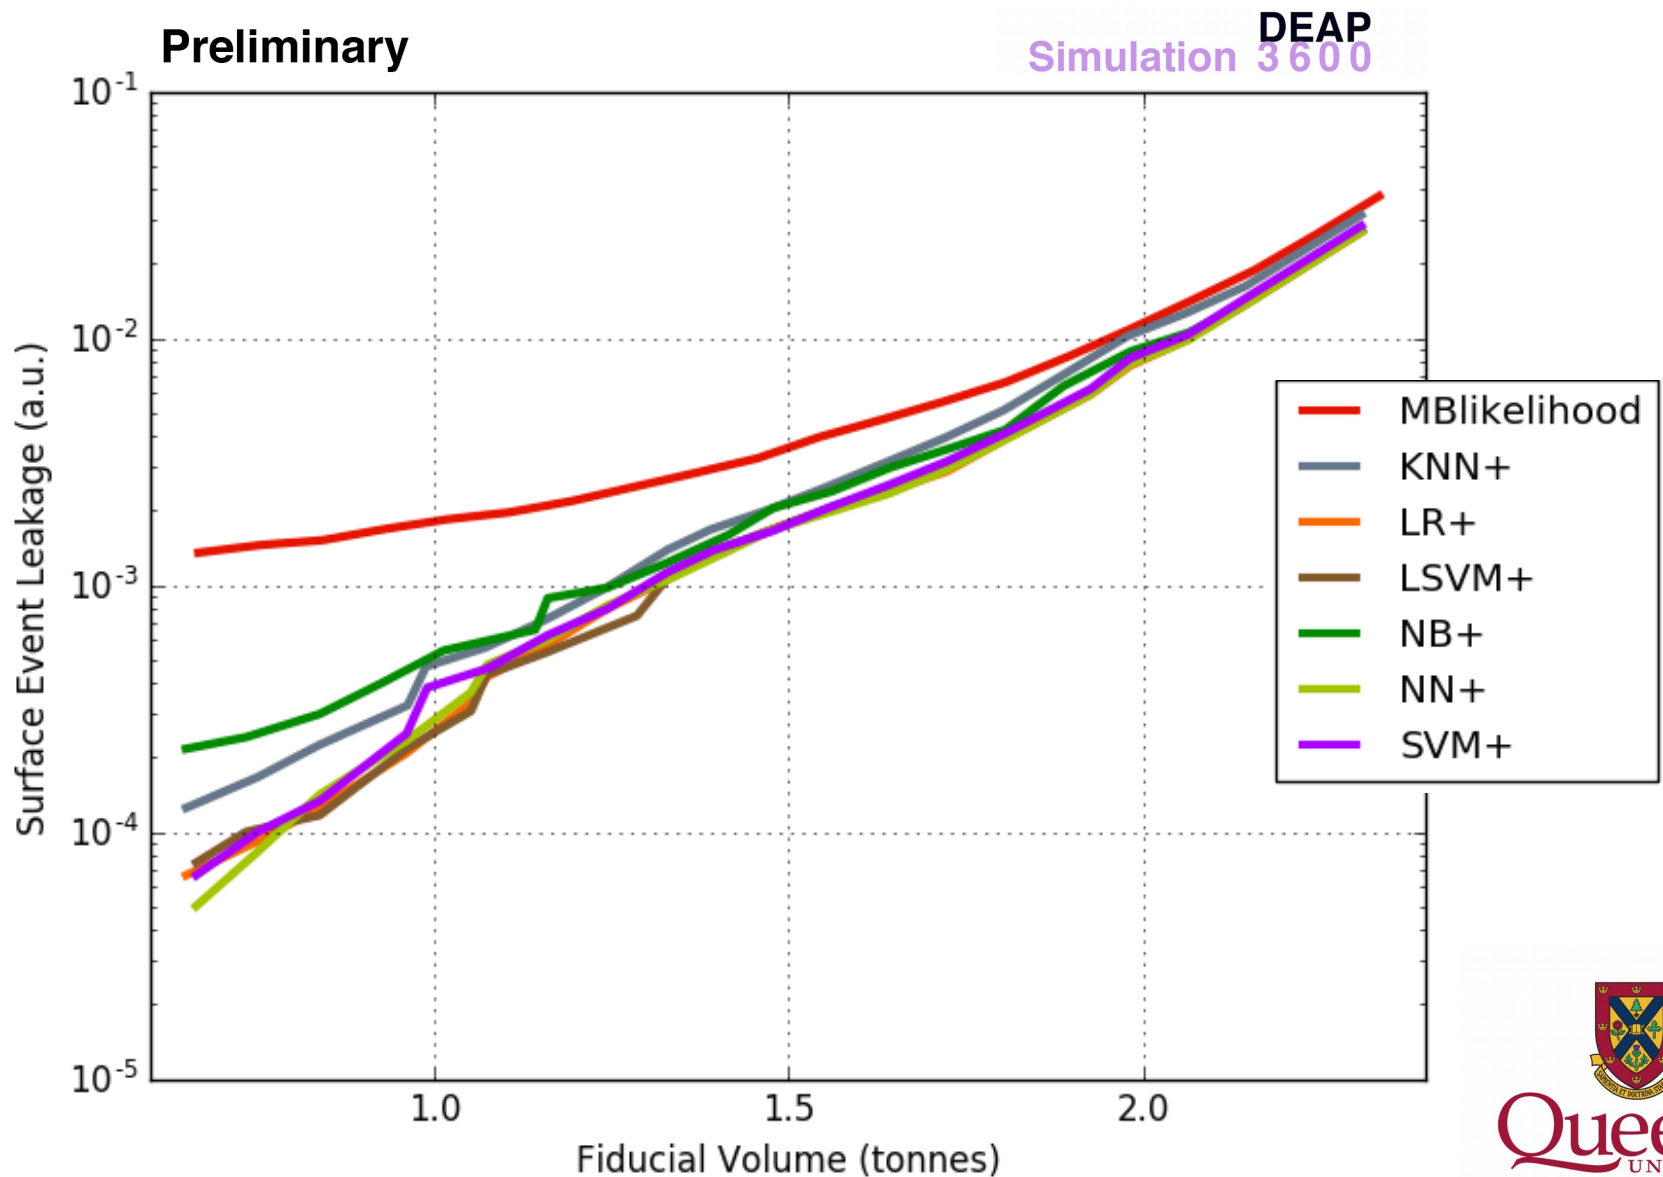

The boosted analysis has an expected energy dependence

The boosted analysis is robust against changes in the optical model

Conclusion: The boosted analysis can increase the fiducial volume by 50%!

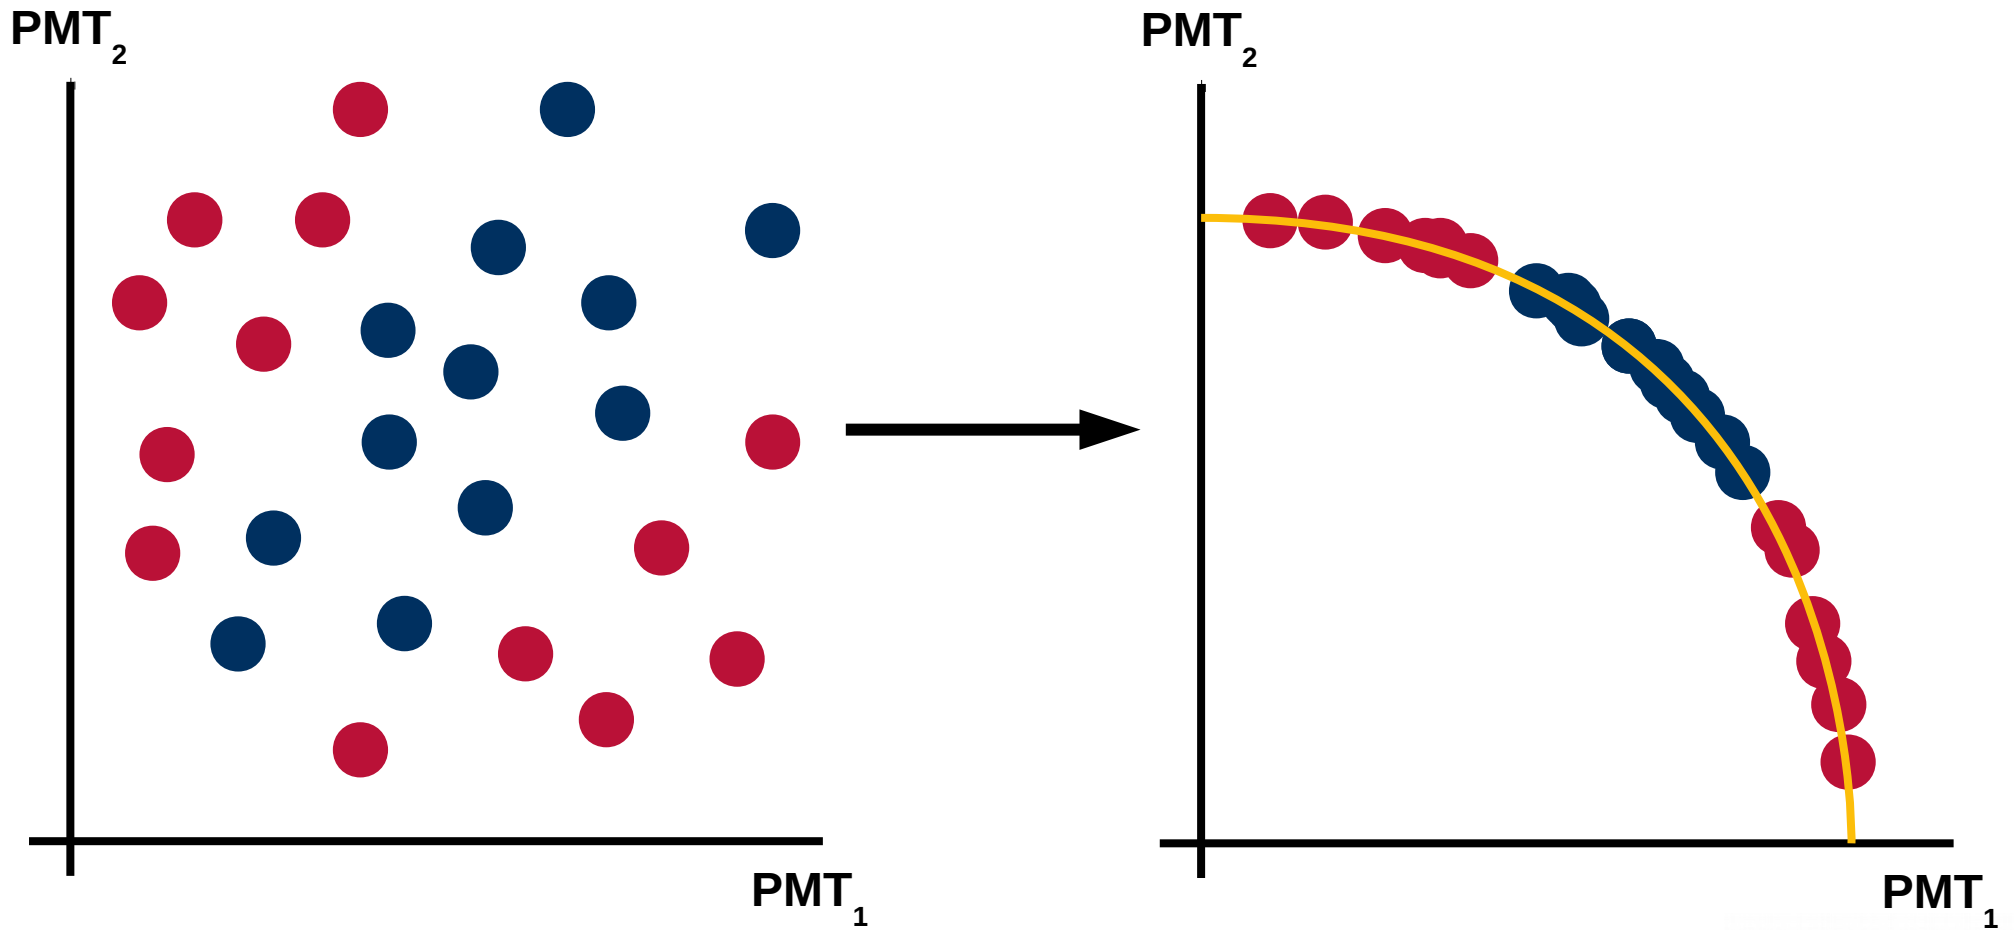

Extra

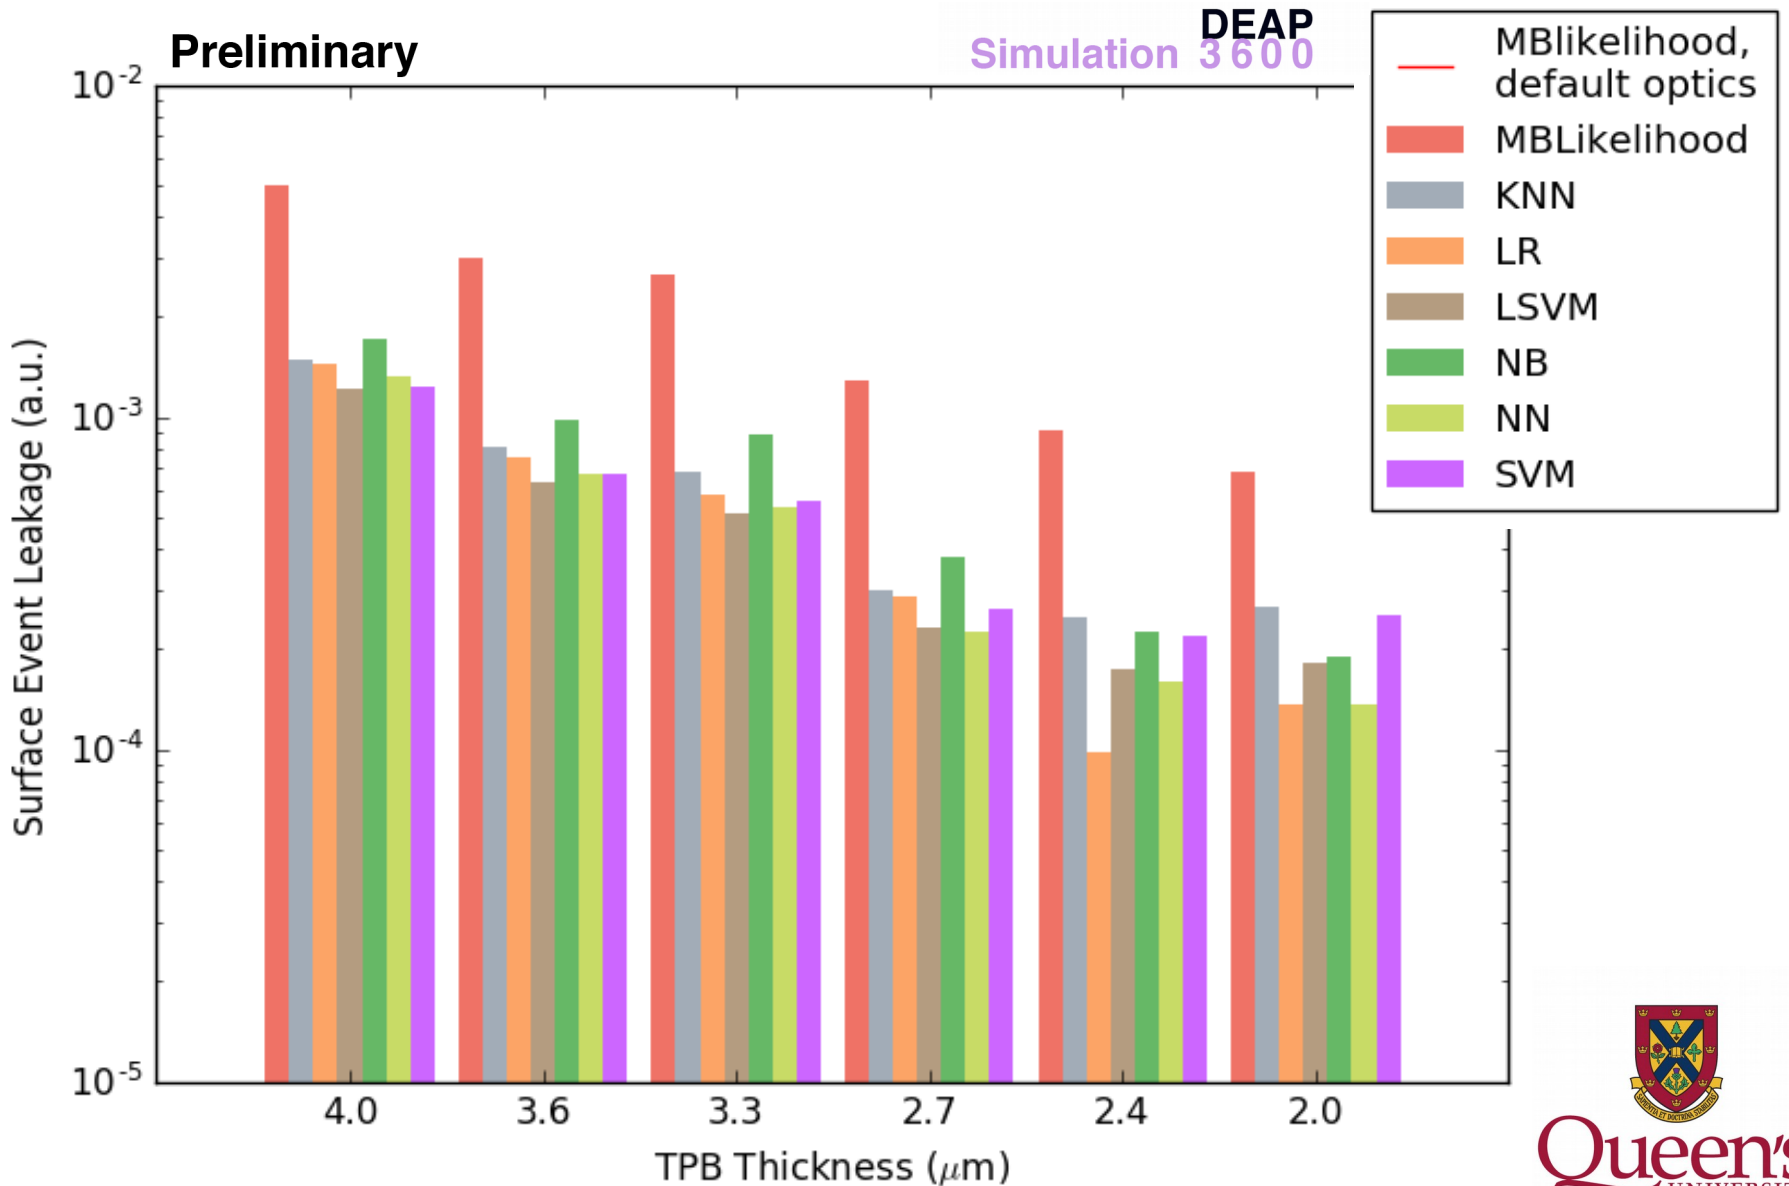

Runtime is very different for each algorithm

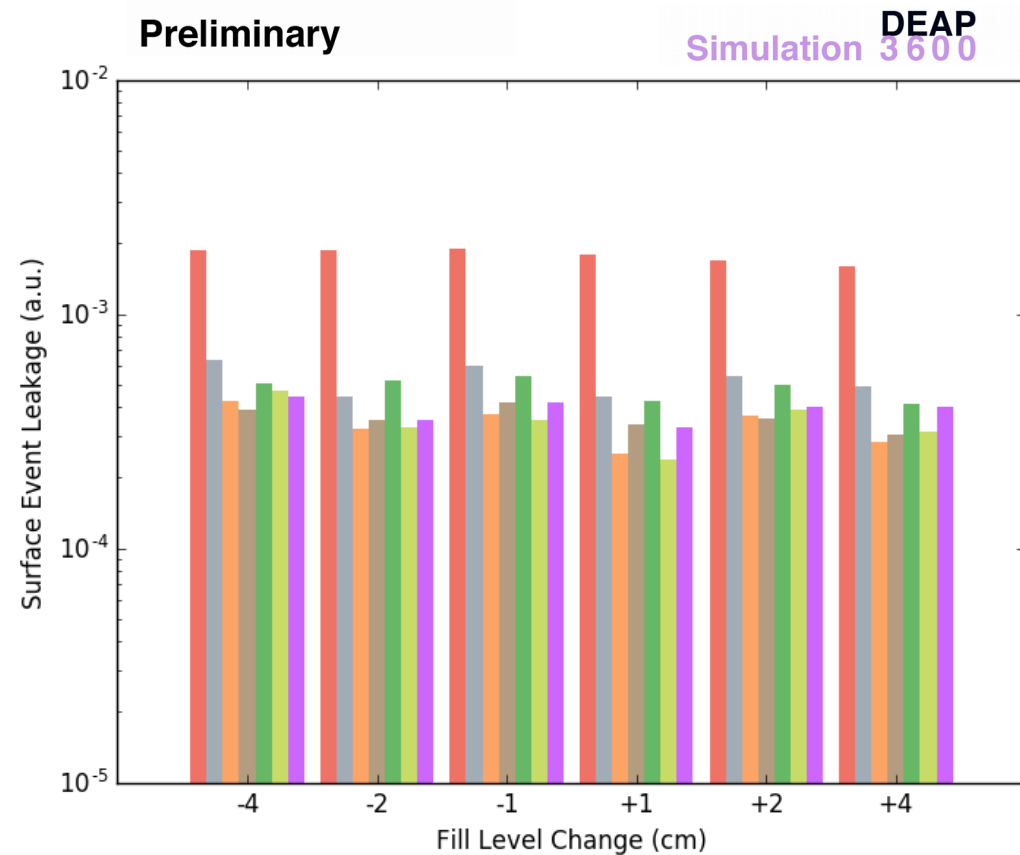

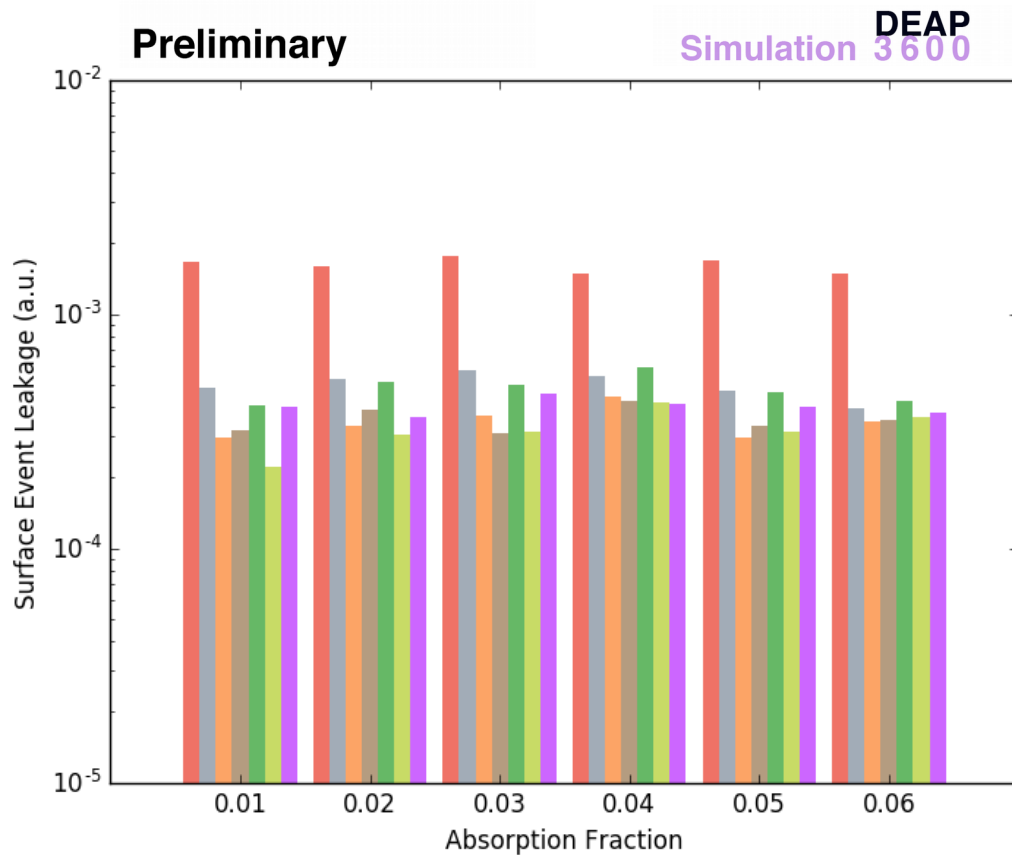

Preprocessing the data allows for easier surface event classification

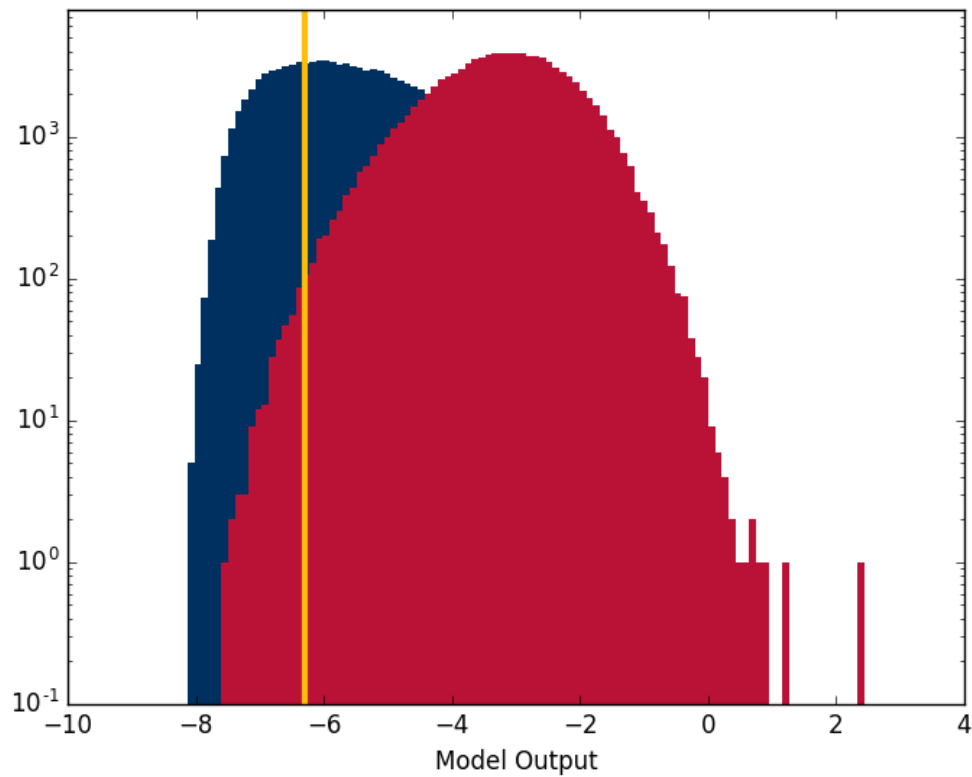

Machine Learning is robust against changes in the optical model

Some optical properties don't affect MBLikelihood or the boosted analysis

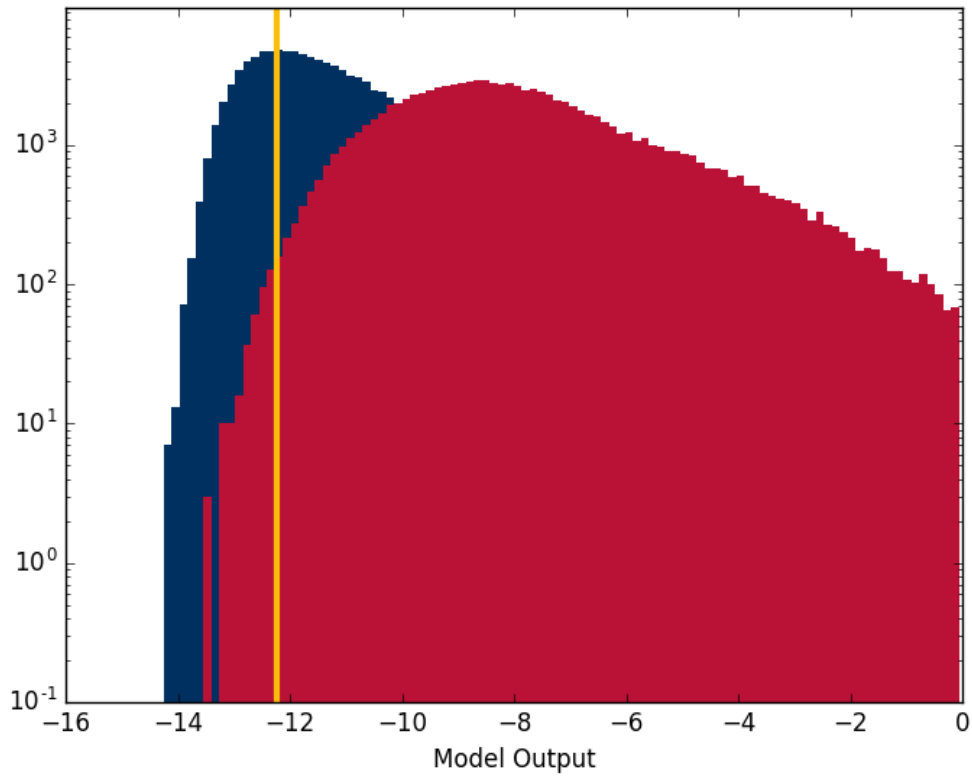

Support Vector Machine

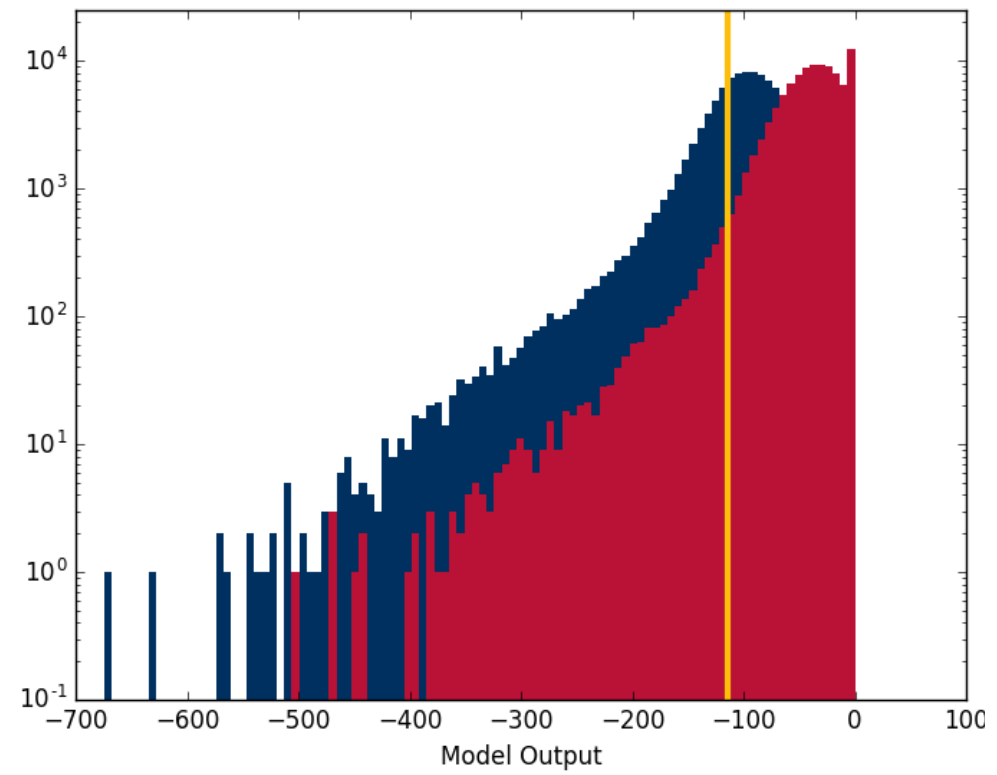

Logistic Regression

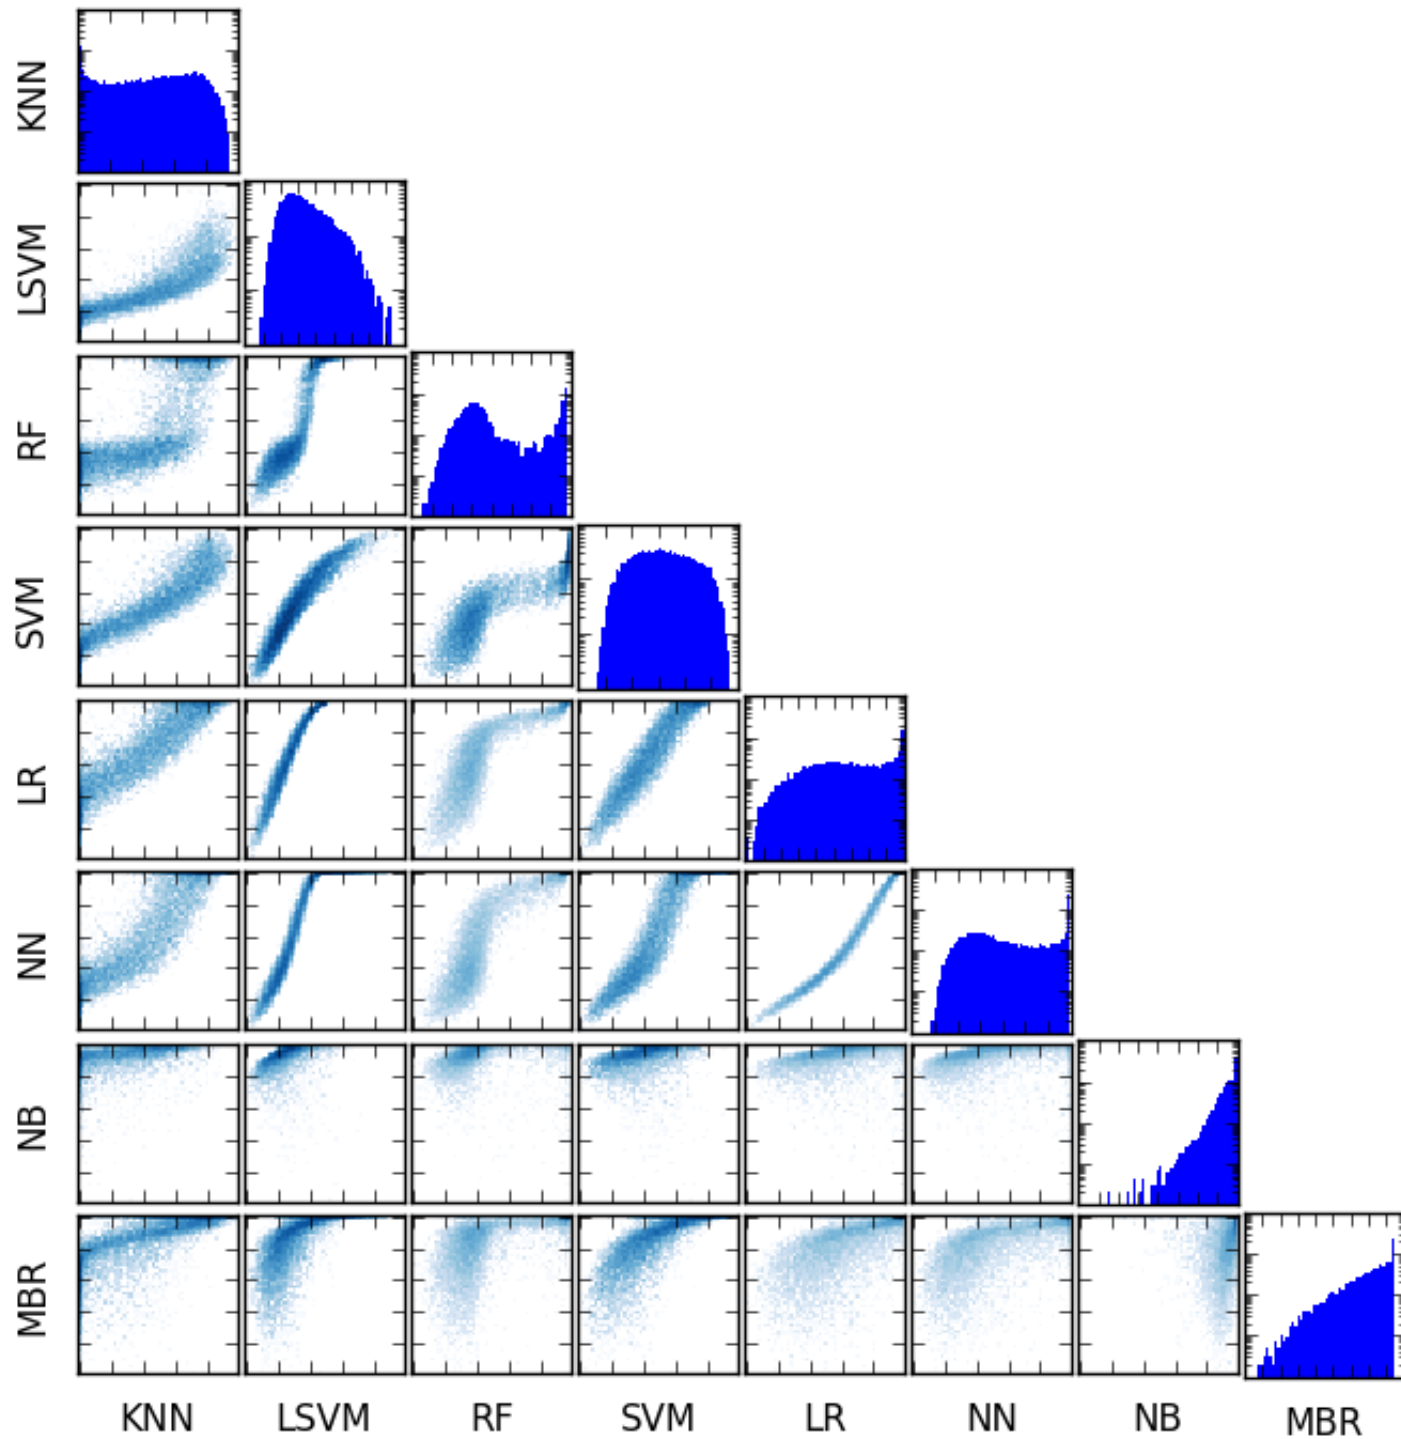

Neural Network

Naive Bayes

^{210}Po event leakage is reduced with the boosted analysis
