Characterization of the Si:Se+ spin-photon interface

Wednesday 5 June 2019 11:15 (15 minutes)

Ionized chalcogen donors in silicon, such as S+, Se+, and Te+, offer excellent spin qubit properties on par with the commonly studied group V hydrogenic "shallow"donors such as phosphorus. These deep chalcogen donors have the additional advantage of spin-selective, mid-infrared optical access to their lowest excited valley-orbit states. By coupling this optical transition to silicon photonic cavities this provides a natural means of connecting qubits within a cavity-QED architecture. Here we characterize key features of this optical transition in Si:Se+, including the transition dipole moment, radiative efficiency, phonon sideband, and orbital excited state lifetime. These results inform the viability of Si:Se+ as a spin-photon interface within a silicon photonics quantum platform.

Author: DEABREU, Adam (Department of Physics, Simon Fraser University)

Co-authors: BOWNESS, Camille (Department of Physics, Simon Fraser University); ABRAHAM, Rohan (Department of Physics, Simon Fraser University); MEDVEDOVA, Alzbeta (Department of Physics, Simon Fraser University); MORSE, Kevin (Department of Physics, Simon Fraser University); RIEMANN, Helge (Leibniz-Institut für Kristallzüchtung); ABROSIMOV, Nikolay (Leibniz-Institut für Kristallzüchtung); BECKER, Peter (Physikalisch-Technische Bundesanstalt Braunschweig); POHL, Hans-Joachim (VITCON Projectconsult GmbH); THEWALT, Michael (Department of Physics, Simon Fraser University); STEPHANIE, Simmons (Department of Physics, Simon Fraser University)

Presenter: DEABREU, Adam (Department of Physics, Simon Fraser University)

Session Classification: W1-9 Condensed matter systems & related: experiment & theory (DCMMP) | systèmes de matière condensée et expérience et théorie connexes (DPMCM)

Track Classification: Condensed Matter and Materials Physics / Physique de la matière condensée et matériaux (DCMMP-DPMCM)
