Search for single production of a vector-like T quark decaying into a Higgs boson and top quark with fully hadronic final states using the ATLAS detector

Monday 6 June 2022 14:15 (15 minutes)

A search is made for a vector-like T quark decaying into a Higgs boson and a top quark in 13 TeV protonproton collisions using the ATLAS detector at the Large Hadron Collider with a data sample corresponding to an integrated luminosity of 139 fb⁻¹.

The all-hadronic decay modes $H \to b\bar{b}$ and $t \to bW \to bq\bar{q}'$ are reconstructed as large-radius jets and identified using tagging algorithms.

Improvements in background estimation, signal discrimination, and a larger data sample, contribute to an improvement in sensitivity over previous all-hadronic searches.

No significant excess is observed above the background, so limits are set on the production cross-section of a singlet T quark at 95% confidence level, depending on the mass, m_T , and coupling, κ_T , of the vector-like T quark to Standard Model particles.

This search targets a mass range between 1.0 to 2.3 TeV, and a coupling value between 0.1 to 1.6, expanding the phase space of previous searches.

In the considered mass range, the upper limit on the allowed coupling values increases with m_T from a minimum value of 0.35 for $1.07 < m_T < 1.4$ TeV up to 1.6 for $m_T = 2.3$ TeV.
