

The Main Detector System for the MOLLER Experiment

Brynne Blaikie

Dr. Michael Gericke, Dr. Jie Pan, Dr. Dustin McNulty, Jared Insalaco, Nafis Niloy

The MOLLER Collaboration

Outline

Motivation

MOLLER Overview

Main Detector Array

Electronics

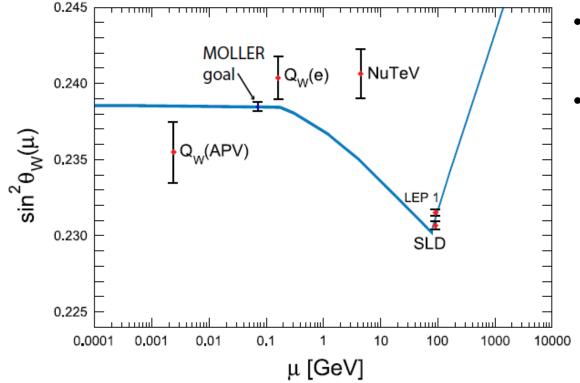

Radiation Testing

Weak Mixing Angle

- The weak mixing angle is a central parameter in electroweak sector of SM
- **MOLLER** will determine $\sin^2 \theta_W$ at average $Q^2 = 0.0056 \text{ GeV}^2$ using parity violating electron scattering:

$$A_{PV} = \frac{\sigma_R - \sigma_L}{\sigma_R + \sigma_L} = m_e E \frac{G_F}{\pi \alpha \sqrt{2}} \frac{4 sin^2 \theta}{(3 + cos^2 \theta)^2} Q_W^e$$
 with
$$Q_W^e = -(1 - 4 sin^2 \theta_W)$$

 A_{PV} predicted to be \approx 33 ppb

MOLLER Goal:

$$\delta A_{PV} = 0.8 \text{ ppb}$$

$$\Rightarrow \Delta Q_W^e = 2.4\%$$

$$\Rightarrow \Delta \sin^2 \theta_W = 0.1\%$$

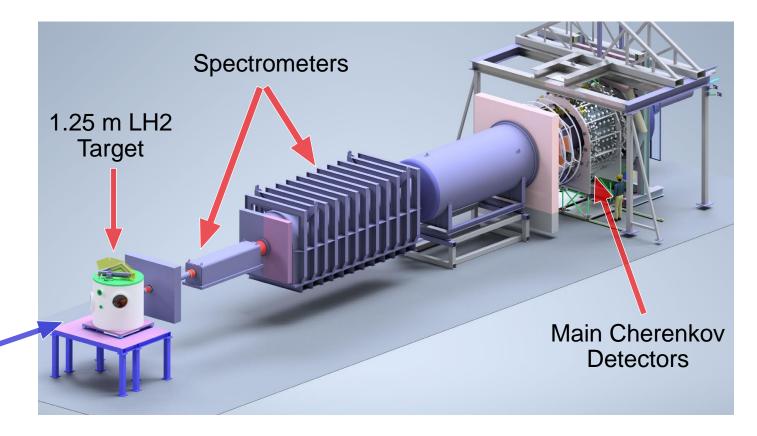

The MOLLER Experiment

- Hall A at Jefferson Lab
- 11 GeV longitudinally polarized electron beam
- Highly polarized $\geq 90 \pm 0.5\%$ electron beam with a fast helicity flip rate

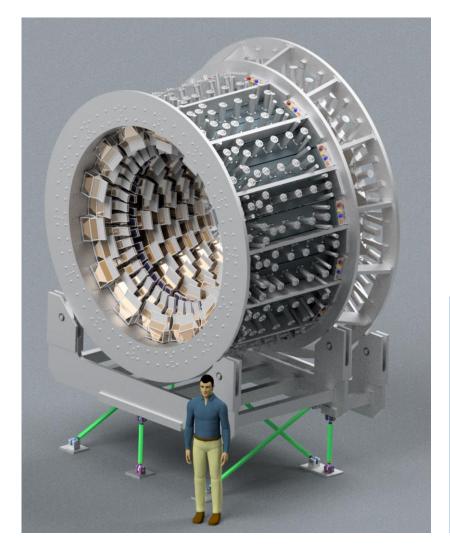

11 GeV Electron Beam

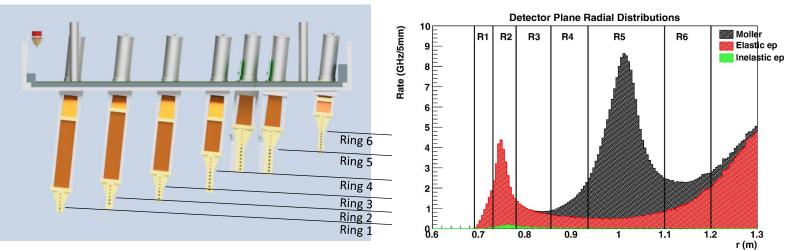

Main Detector System

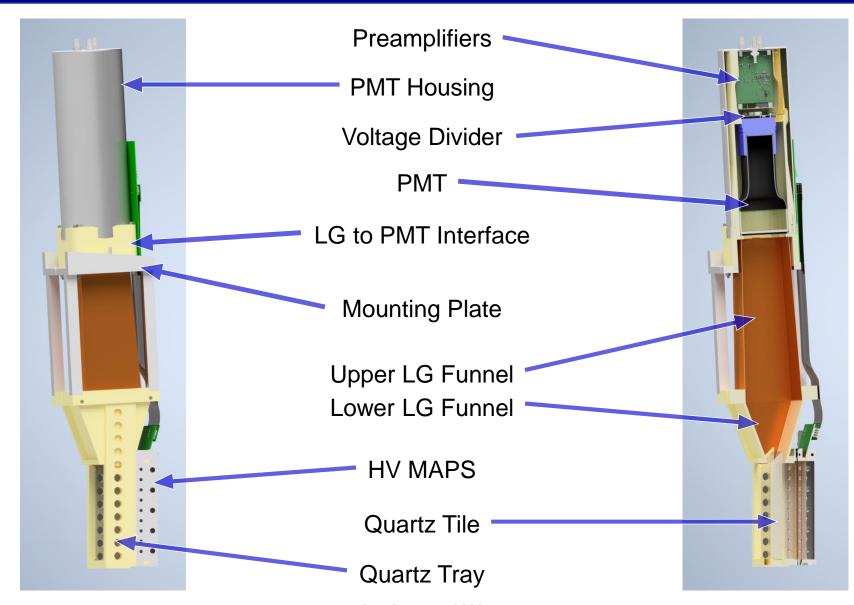

- 224 Detectors
 - Radially split into 6 Rings
 - Azimuthally split into 28 Segments
- Located 26.5 m downstream from target
 - Sufficient space for spectrometers to separate e-e and e-p peaks
- Full coverage of Møller events
- Integration and counting mode data collection

Ring 5 Module

Front-end Electronics Radiation Testing

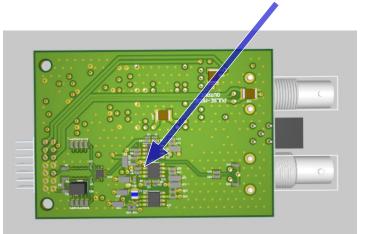

Switchable PMT base for two different running modes

Counting Mode: higher gain, tracking and diagnostics

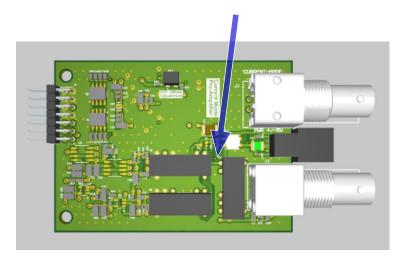

Integration Mode: lower gain, asymmetry measurements

Expected absorbed dose in front-end electronics region: **60 krad**

Op Amps

DC-DC Converters

Designed by Jie Pan

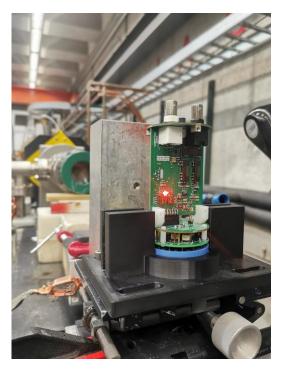

Radiation Testing

- Idaho Accelerator Center in Pocatello, Idaho with the ISU group
 - 8 MeV pulsed electron beam, 10 mA peak current, 100 ns pulse width
 - ~1 nC/pulse
- Used collimators to localize beam dose on specific electronic chips
- Beam dose/pulse profile measured using Optically Stimulated Luminescence dosimeters
 - Each ~1 cm²
 - Placed into 3D printed tray to mimic electronic chip locations on preamplifier
- Laser used to align components in beam
- Used OSL measurements, conversion factor, and charge data to calculate dose on chips
 - ~75% dose in OSL received in chips

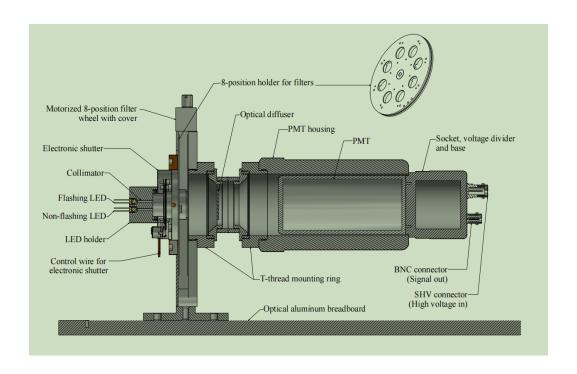

- Tested functionality between doses using 16 channel MOLLER ADC board
- Exposed PMT to set of light levels (producing 2, 5, 20, 27 nA) using constant LED and with LED off and HV off

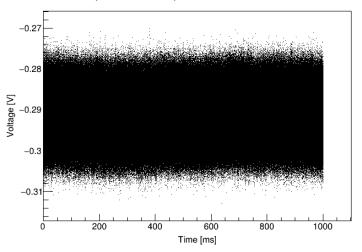

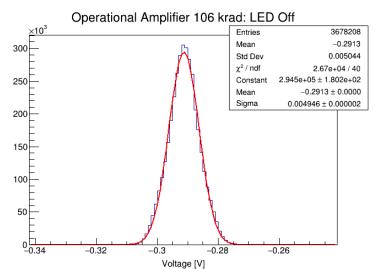

PMT Base 1 Op Amps	Dose [krad]	Total Dose [krad]
Run 0 *	106	106
Run 1	106	212
Run 2	210	422
Run 3	210	632
Run 4	106	739
Run 5	106	845
Run 6	106	950
Run 7	318	1,270
Run 8	106	1,480
Run 9	210	1,586

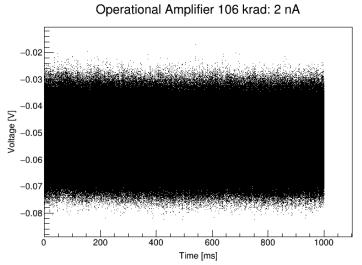

Operational Amplifier 106 krad: LED Off

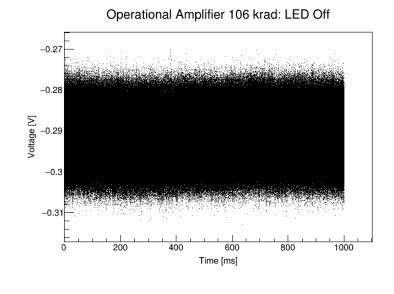

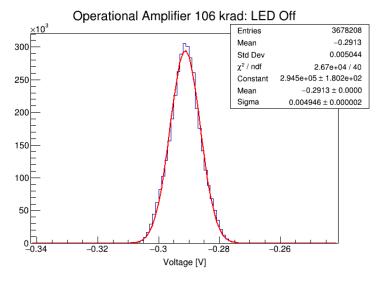

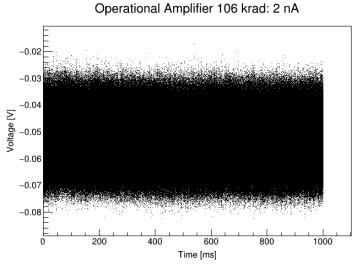

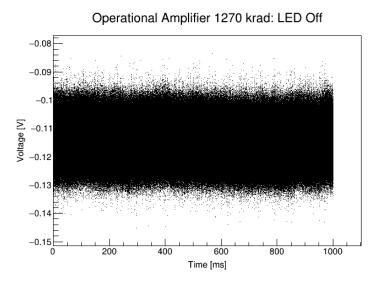

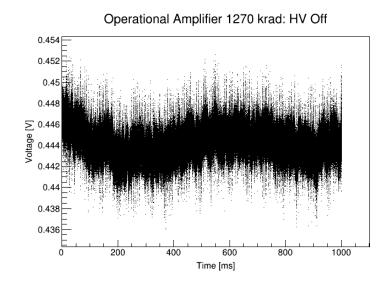

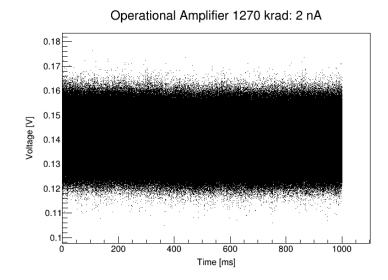

Operational Amplifier 1480 krad: LED Off

Time [ms]

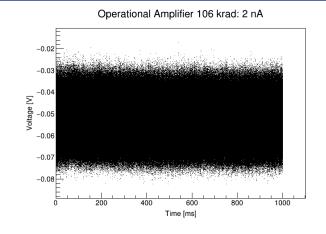

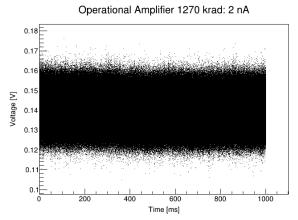

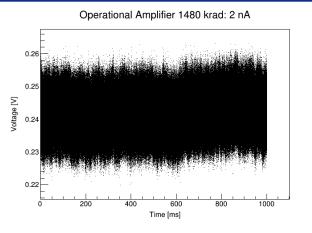

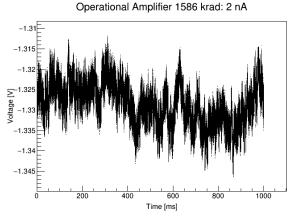

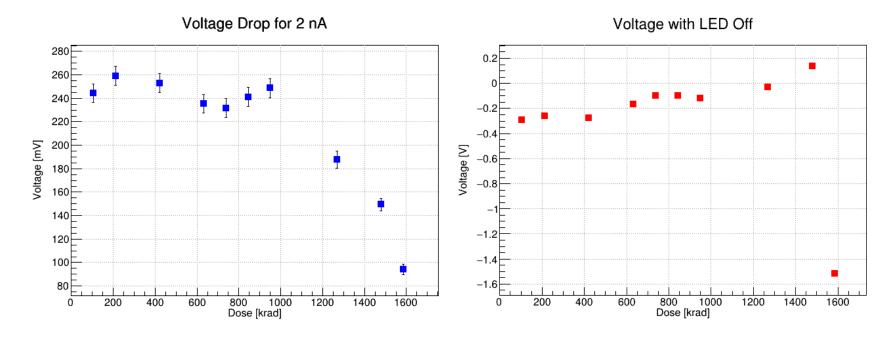

- Started to fail <1270 krad
- Noticeable gain loss and offset shift
- 60% voltage drop in 2 nA by 1586 krad
- Sufficiently radiation hard for MOLLER

DC-DC Converters

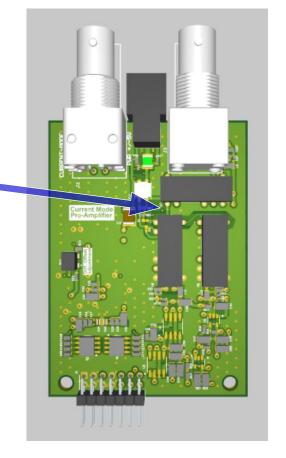

- Applied LV power to preamplifier after initial dose
- Immediate increase in current draw
- Chips became extremely hot
- Repeated dosing on previous PMT base with smaller increments
 - Failure between 50 100 krad

PMT Base 2 DC-DC Converters	Dose [krad]	Total Dose [krad]
Run 1	206	206

PMT Base 1 DC-DC Converters	Dose [krad]	Total Dose [krad]
Run 1	10.5	10.5
Run 2	42	52
Run 3	53	104

Summary and Future Work

- MOLLER main detector array design nearly complete
- Radiation testing of detector electronics underway
- Integration mode amplifiers sufficiently radiation hard
- Require further testing of DC-DC converters and other radiation sensitive components
- Possible updates to integrated PMT base
- Plans to install MOLLER in 2025
- Commissioning start of 2026

Thank You

with massive thanks to the ISU group
