Towards (Even) Higher Precision Measurements of ϕ_s

Subleading Effects:

- ▶ A closer look at $B_s^0 \rightarrow J/\psi \phi$:

$$|A(B_s^0 \rightarrow J/\psi \phi)|^2 = \left| \text{Tree} + \epsilon \text{ Penguin} + \dots \right|^2$$

- ▶ Experimentally measure an **effective mixing phase**

$$\phi_s^{\text{eff}}(B_s^0 \rightarrow J/\psi \phi) = \phi_s + \Delta\phi_s$$

- ▶ $\Delta\phi_s$ is a shift due to penguin topologies
- ▶ Controlling these higher order hadronic effects becomes **mandatory!**
- ▶ Relying on $SU(3)$ flavour symmetry: constrain with $B^0 \rightarrow J/\psi \rho^0$.
