

# Searches for resonances decaying to boson pairs in ATLAS

*Panagiotis Bellos*

UNIVERSITY OF  
BIRMINGHAM

This project has received funding from the European Research Council (ERC) under the European Union's Horizon 2020 research and innovation programme under grant agreement no 714893 (ExclusiveHiggs)

*23/2/2023*

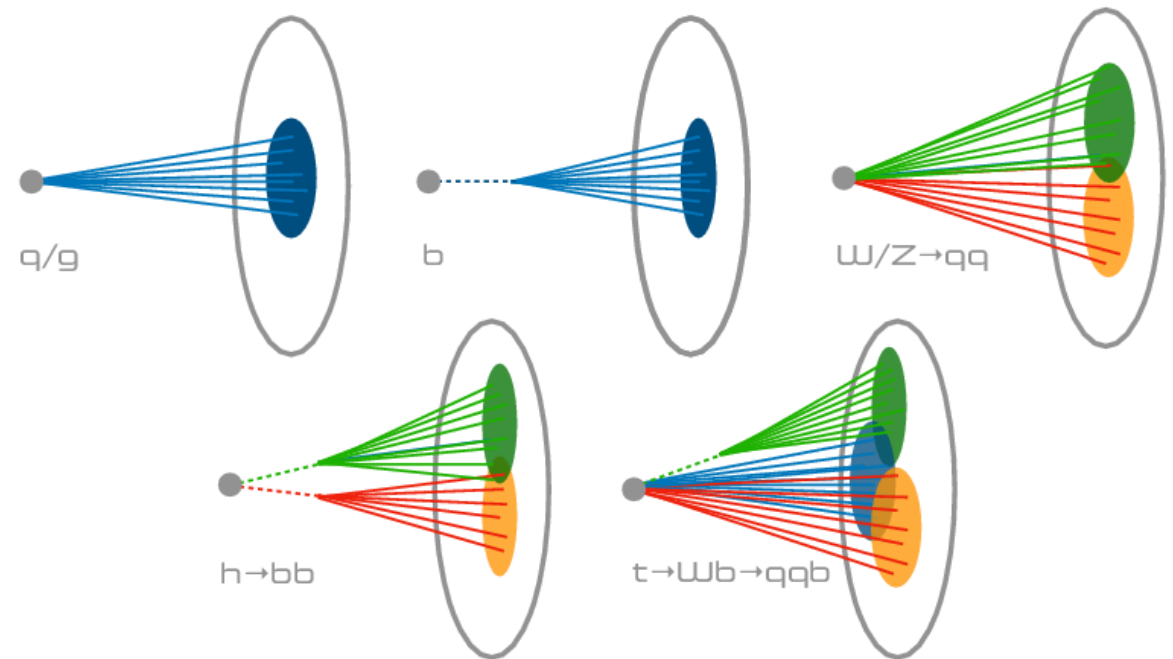

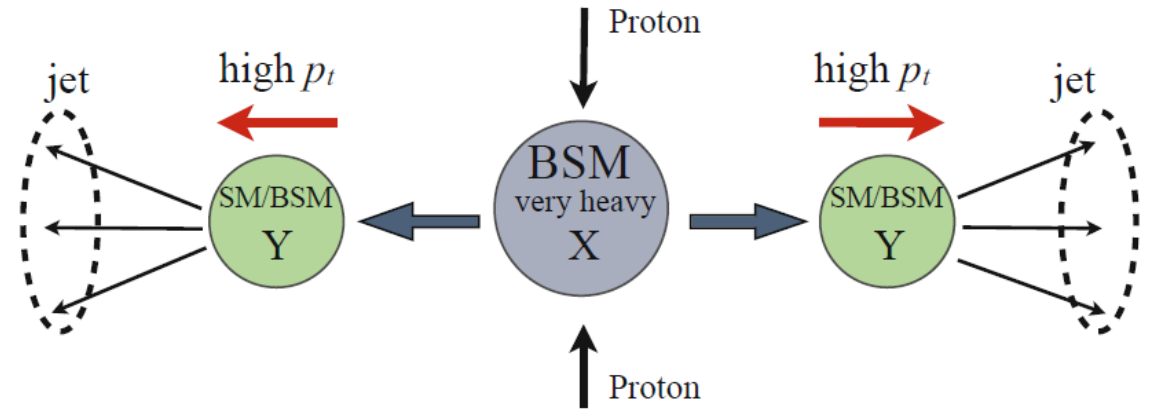

- **2 Higgs Doublet Model (2HDM)**
  - 2 neutral ( $H, h$ ), 1 pseudoscalar ( $A$ ), 2 charged ( $H^\pm$ )
- **Seesaw model (type II)**
  - 4 charged ( $H^{\pm\pm}, H^\pm$ ), 1 pseudoscalar ( $A^0$ ), 2 neutral ( $H^0, h^0$ )
- **Georgi–Machacek (GM) model**
  - A fiveplet  $H_5^{++}, H_5^+, H_5^0, H_5^-, H_5^{--}$
- **Heavy Vector Triplet (HVT)**
  - 3 heavy vector bosons ( $W'^\pm, Z'$ )
- **Warped Extra Dimensions**
  - Spin 2 Graviton, spin 0 Radion
- **Axion Like Particles**
- **Model independent resonances**

Diboson state	Final states
HH	4b, 2b2W, 2b2τ, 4W, 2b2γ, 2W2γ, 2blvlv
HZ	qqbb, vvbb, llbb
HW	qqbb, lvbb
ZZ	qqqq, vvqq, llqq, llvv, llll
ZW	qqqq, vvqq, lvqq, llqq, lvll
WW	qqqq, lvqq, lvlv
Hγ	bby
Zγ	llγ, qqγ
Wγ	lvγ, qqγ
γγ	γγ

- **Many BSM searches by ATLAS**
  - Currently searches focus on high masses
  - High mass resonances → diboson decays

- **Typical heavy BSM resonance decay**
  - $X \rightarrow 2Y$  high  $p_T$  particles
- **Large hadronic Branching Ratios**
  - $Z \rightarrow$  hadrons  $\approx 70\%$
  - $W \rightarrow$  hadrons  $\approx 67\%$
  - $H \rightarrow$  hadrons  $\approx 80\%$
- **Hadronic decays of high  $p_T$  particles**
  - Highly boosted collimated jets
  - Reconstructed as single large jet
- **Large R-Jets**
  - Anti- $k_T$  aggregates Topo clusters until certain R
  - Increase R from 0.4 to 1 for large jets
  - Particle identification from jet substructure

- **Track-CaloClusters (TCCs)**

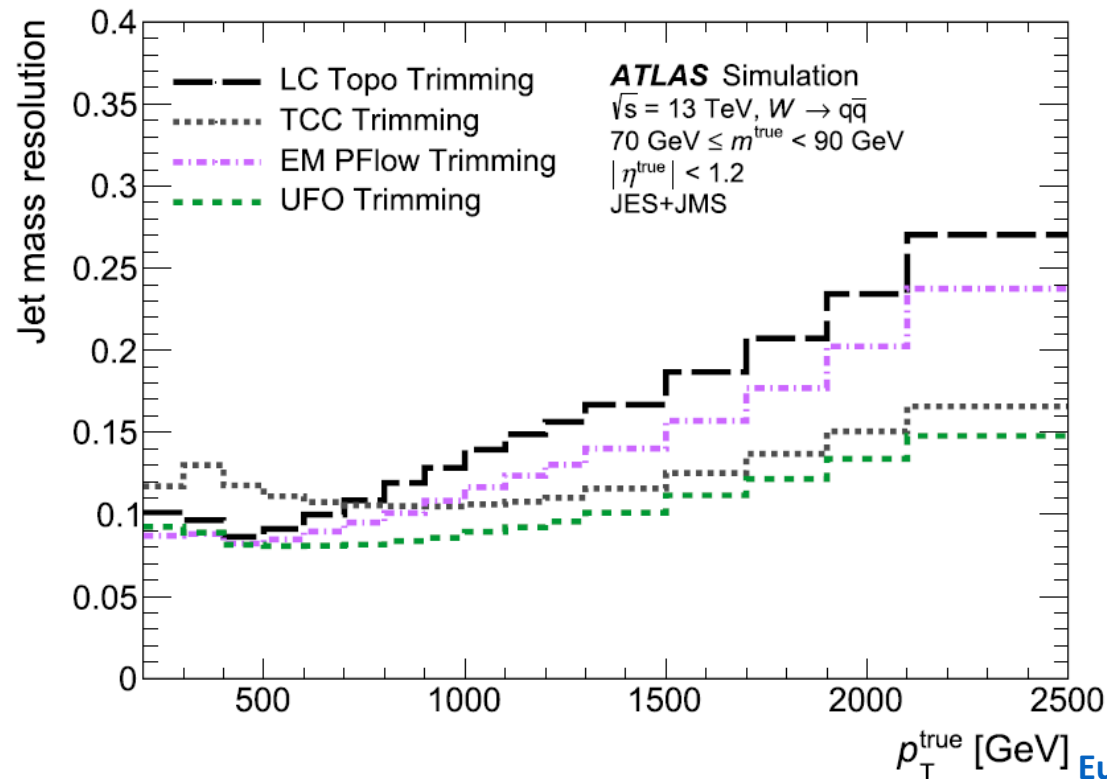

- Developed for massive boosted objects
- Combine the strengths of calorimeter ( $p_T, m$ ) and ID ( $\phi, \eta$ )
- Optimized for jet substructure reconstruction performance
- Better performance on high  $p_T$  jets

- **Unified Flow Objects (UFO)**

- TCCs and Particle Flow Objects merged into UFO
- UFO has overall best performance

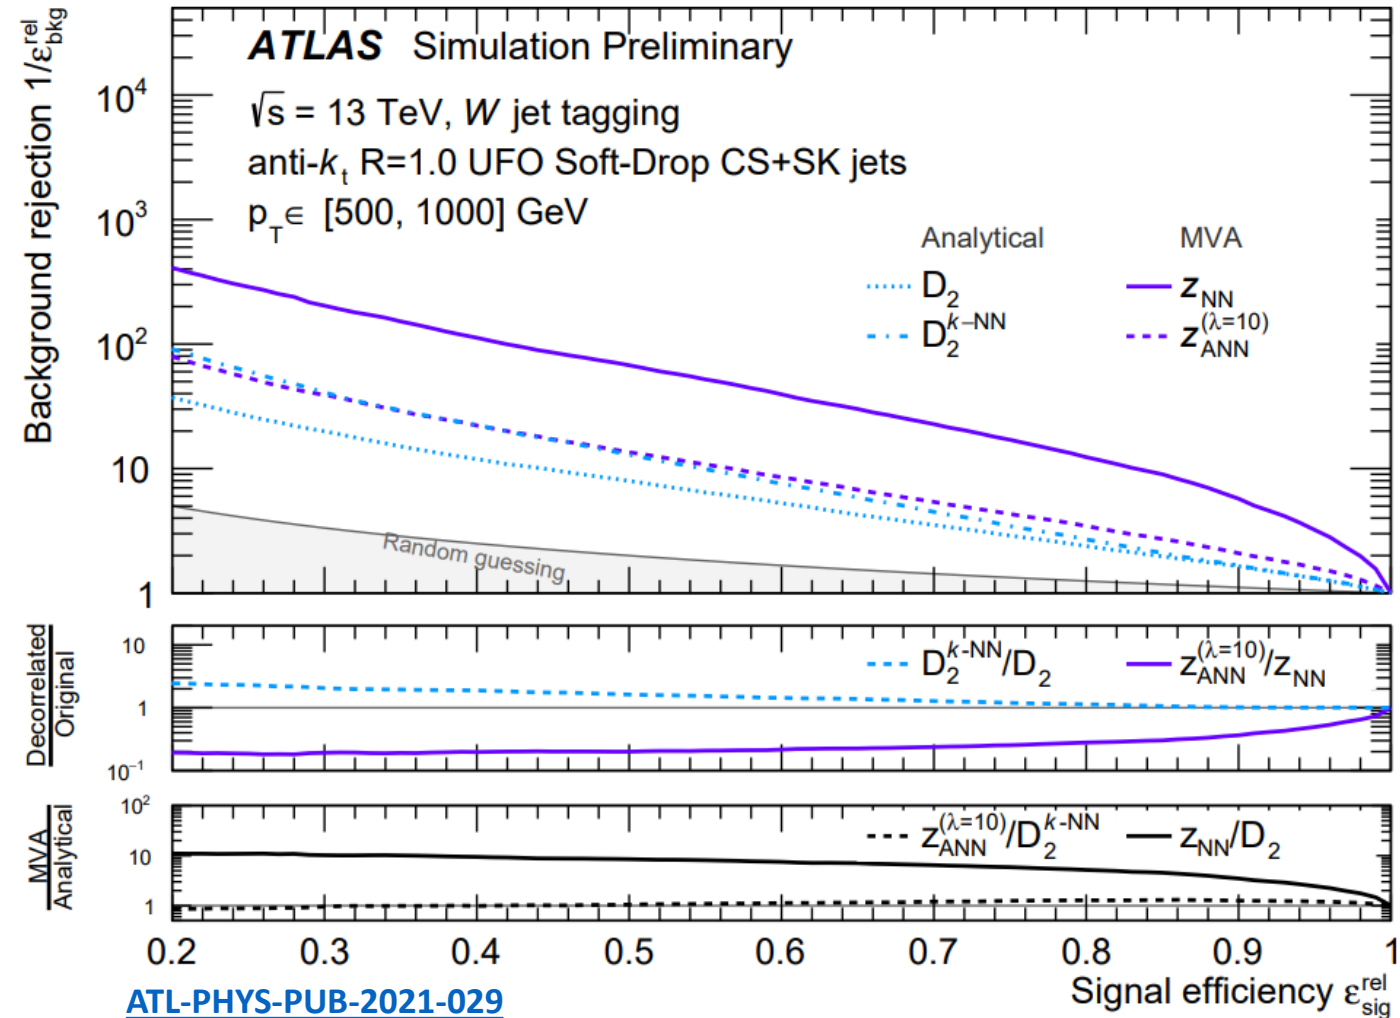

- **Pile – up subtraction and calibration**

- Pile-up mitigation and/or grooming algorithms
- Detector response and simulation mismodelling

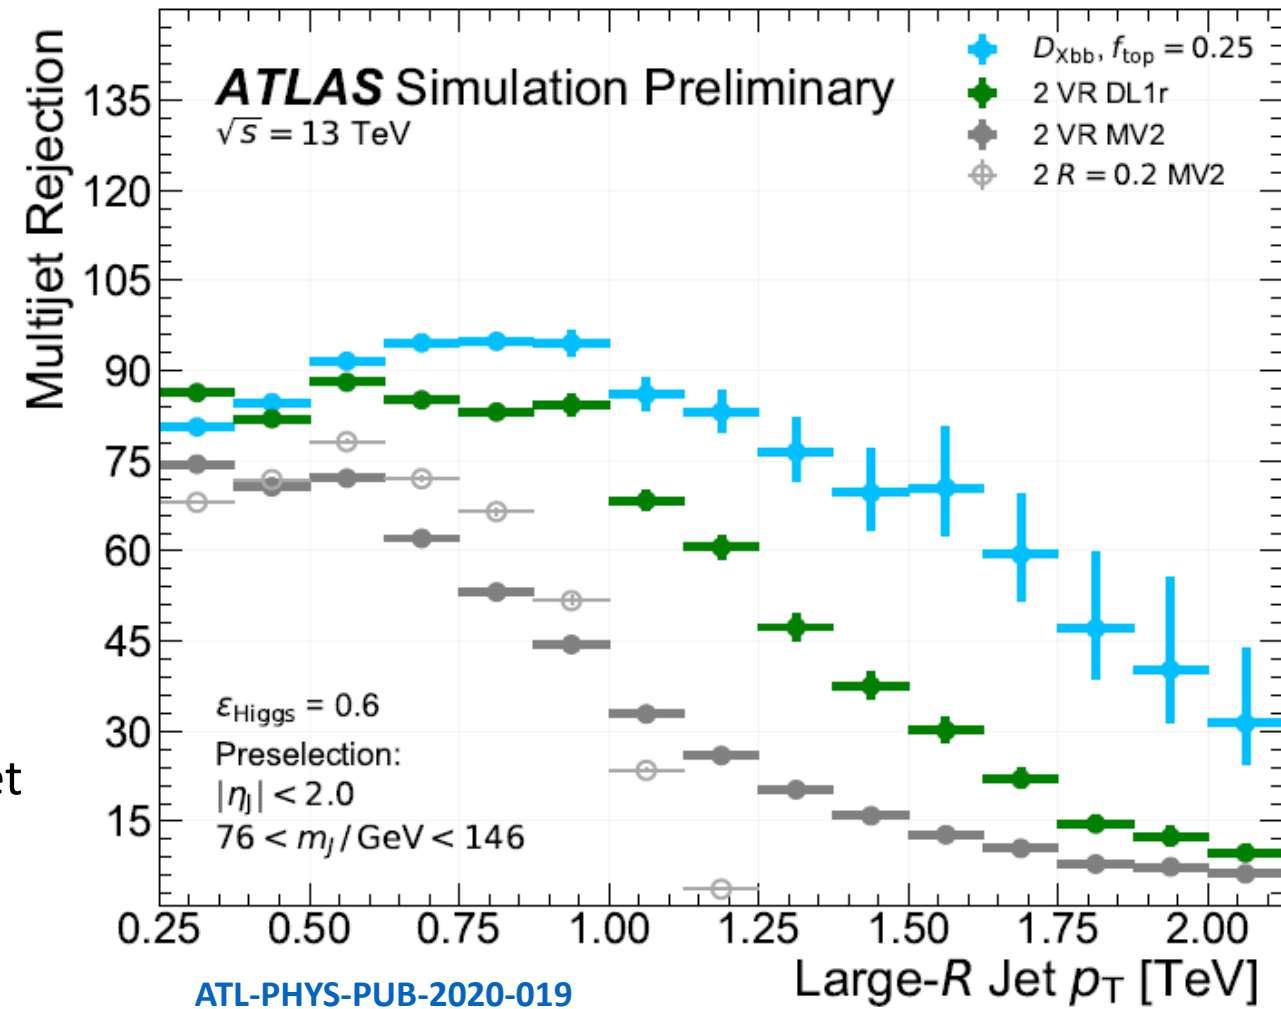

[Eur. Phys. J. C \(2021\) 81:334](#)

- **W/Z tagging**
  - 2-prong decays with relatively equal momentum sharing
- **Machine learning techniques**
  - Sophisticated substructure variables
  - Adversarial NN to ensure no mass correlation
  - x10 improvement in bkg rejection wrt the cut based tagger
  - x2-4 improvement due to using UFO jets

- **Higgs tagging**
  - Usually identified from the b-jets
  - Several exclusive Higgs-tagging algorithms
- **b-jet tagging**
  - Displaced vertex / Large mass / High decay multiplicity
  - Highly sophisticated ML algorithms (DL1r)
  - Jet topology, secondary vertices, tracks
  - DL1r discriminates b, c, light flavor jets
- **Boosted H→bb tagger**
  - Extends the application of b-tagging at the large-R jet
  - Neural network
  - Combines large-R jet kinematics with flavor tagging info

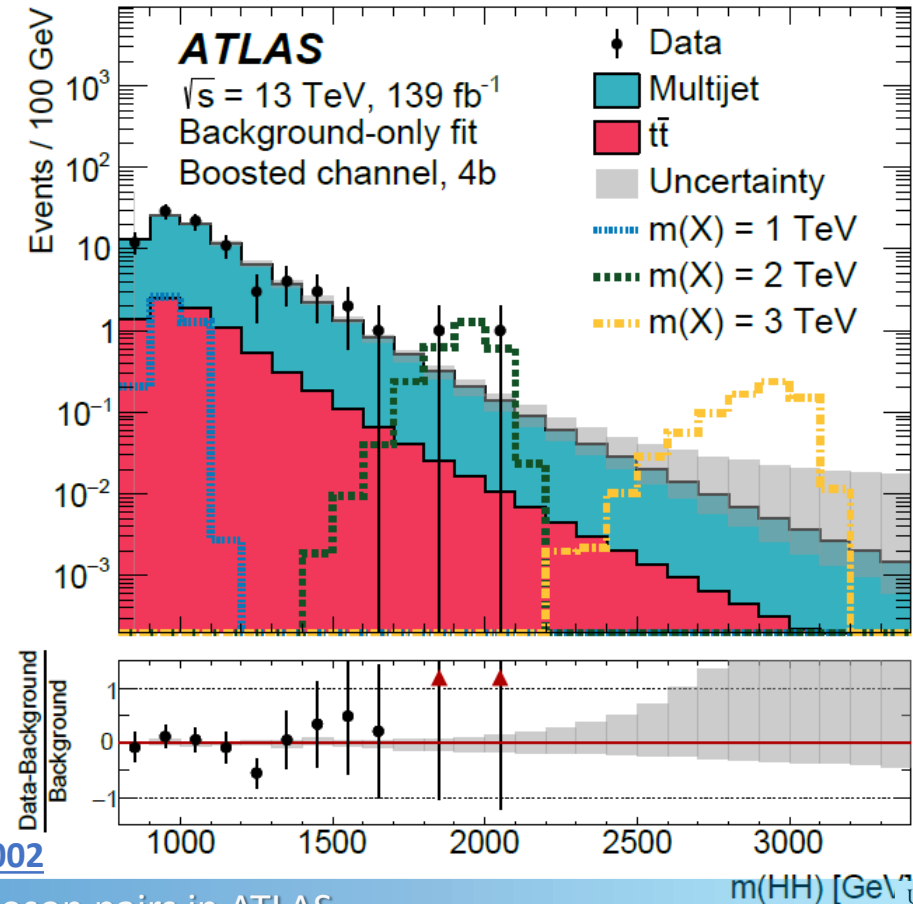

- **Analysis strategy**

- Multijet background
- Boosted / resolved topologies
- 2 large-R jets Topo / 4 small-R PFlow

- 3 signal-enriched categories “4b”, “3b”, “2b”
- Signal region is defined by bb pairs masses
- General spin 0 and Graviton interpretations

Phys. Rev. D 105 (2022) 092002

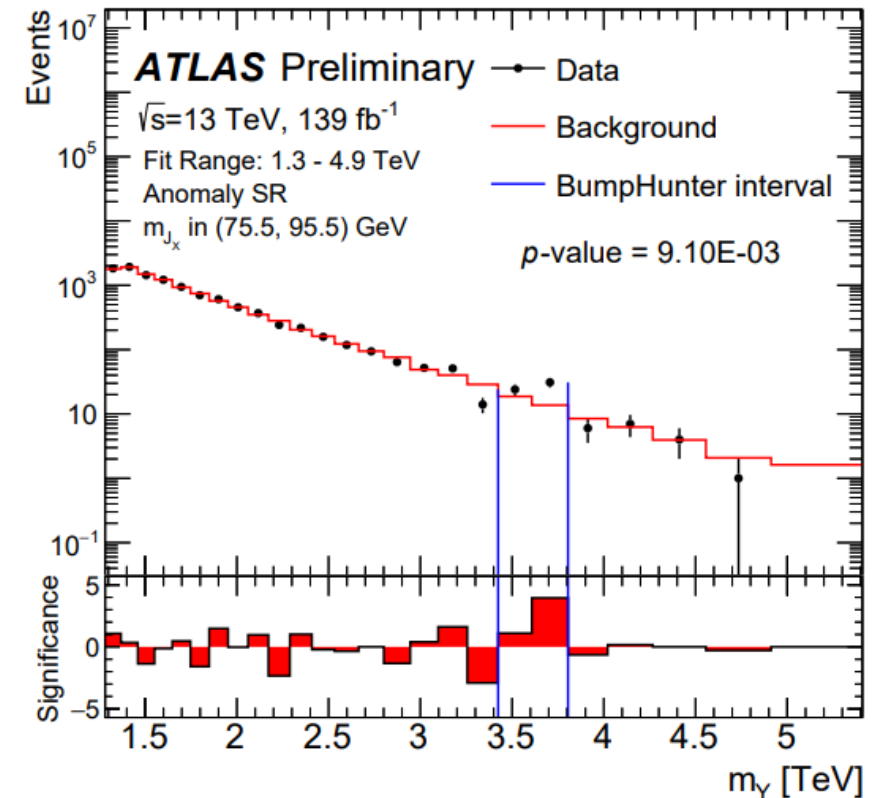

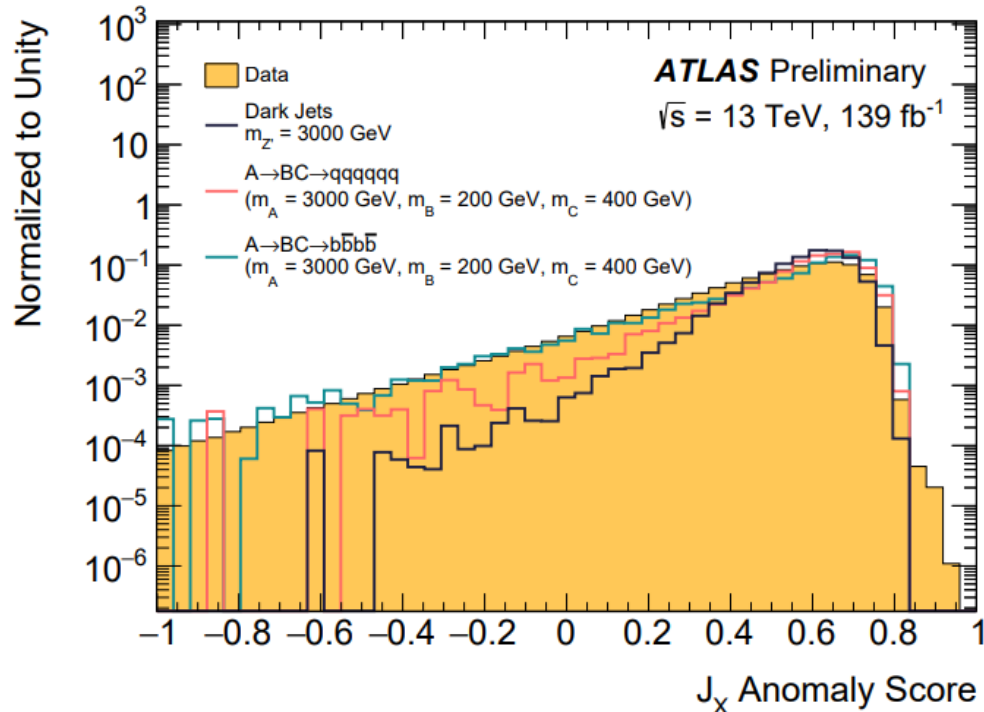

- **Analysis strategy**

- Multijet background
- 2 highest  $p_T$  large-R TCC jets & boosted  $H \rightarrow b\bar{b}$  tagger
- Jet-level Anomaly Score for the Signal Region
- 2 supplementary SRs for 2-prong X decay, boosted/resolved topology
- Small excess found (global significance  $1.47\sigma$ )

- **Variational recurrent neural network (VRNN)**

- Unsupervised learning for Anomaly Detection
- Trained over large jets modeled as sequence of constituent 4-vectors
- Designed to reveal correlations between constituents and substructure to reveal any anomaly

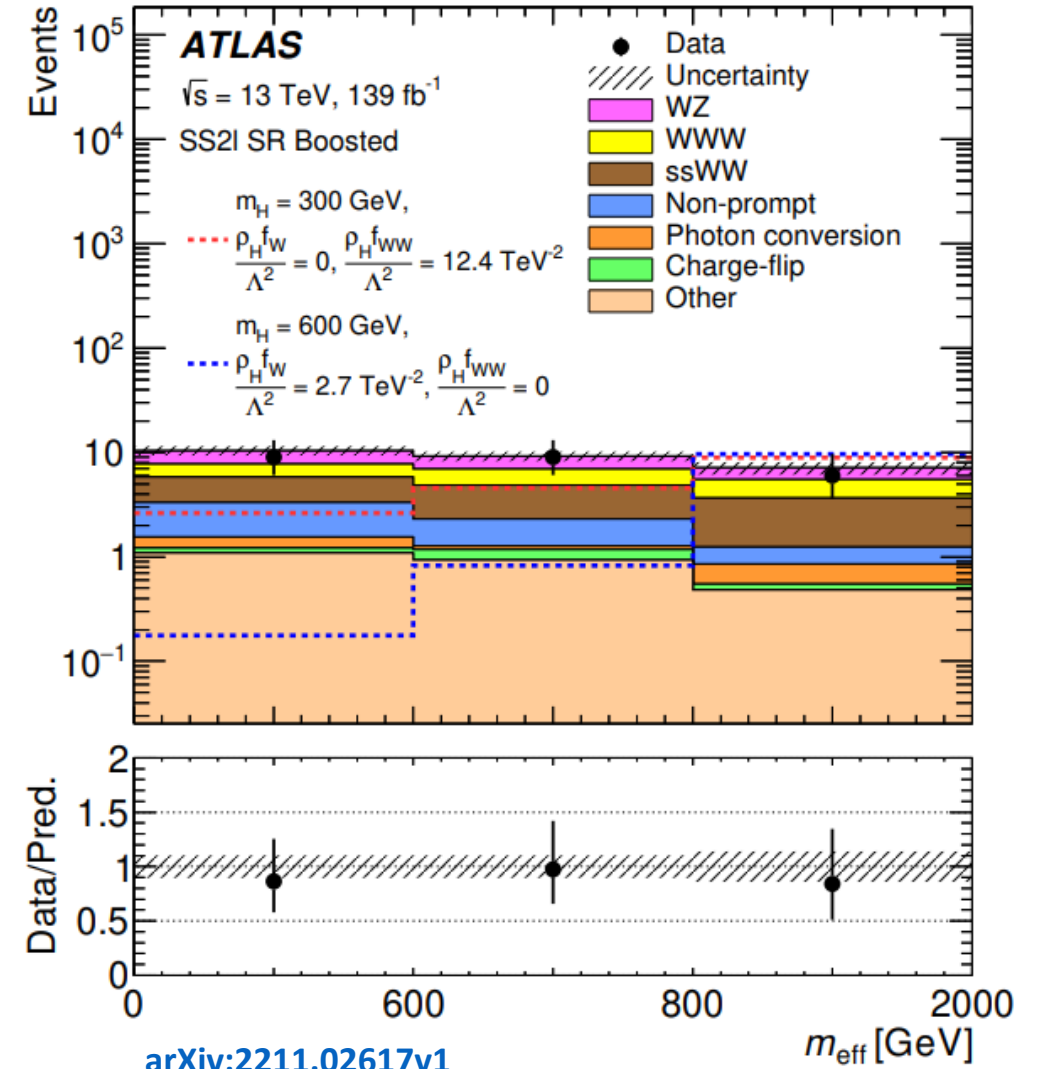

ATLAS-CONF-2022-045

- **Analysis strategy**

- Background from VVV, VV, etc.
- Boosted / Resolved topologies
- 2 leptons,  $E_{\text{Miss}}$ , 1 large Topo / 2 small PFlow jets
- Boson tagger to distinguish W jets
- Effective mass discriminant (sum of  $P_T^{\text{lep}}$ ,  $p_T^j$ ,  $E_{\text{Miss}}$ )

- **W/Z tagger**

- 3D (jet mass,  $D_2$ ,  $n_{\text{trk}}$ ) tagger
- Parametrized as function of  $p_T$
- Optimized for maximum significance

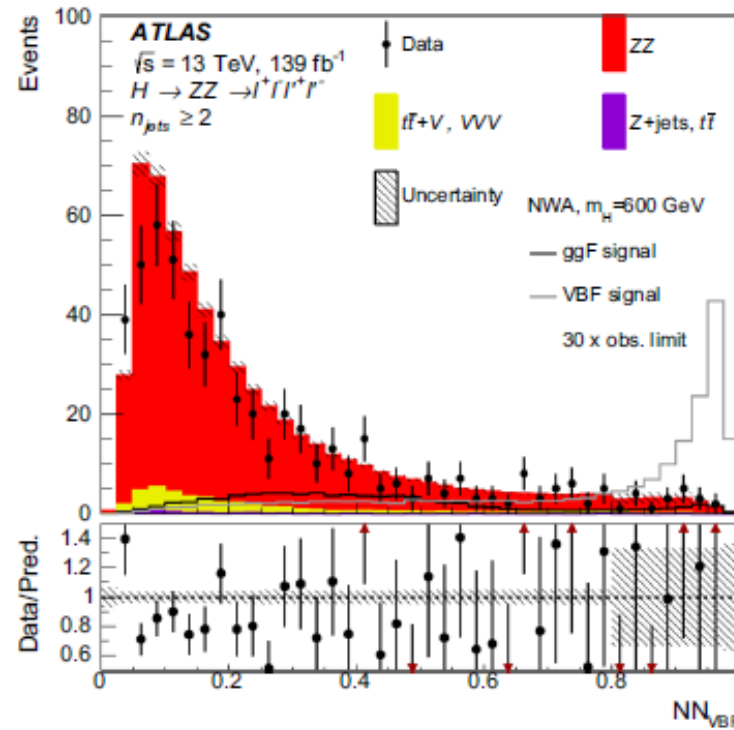

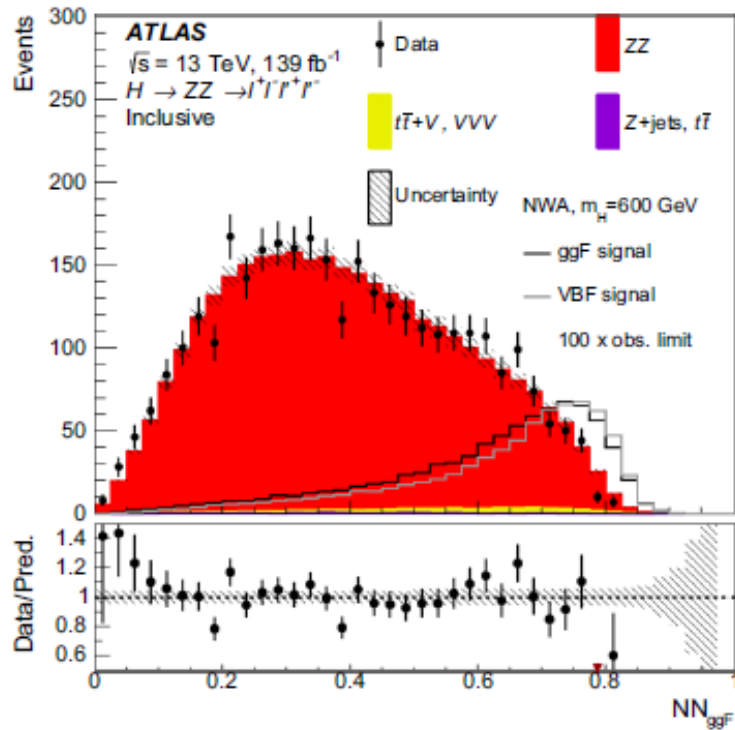

- **Analysis strategy**

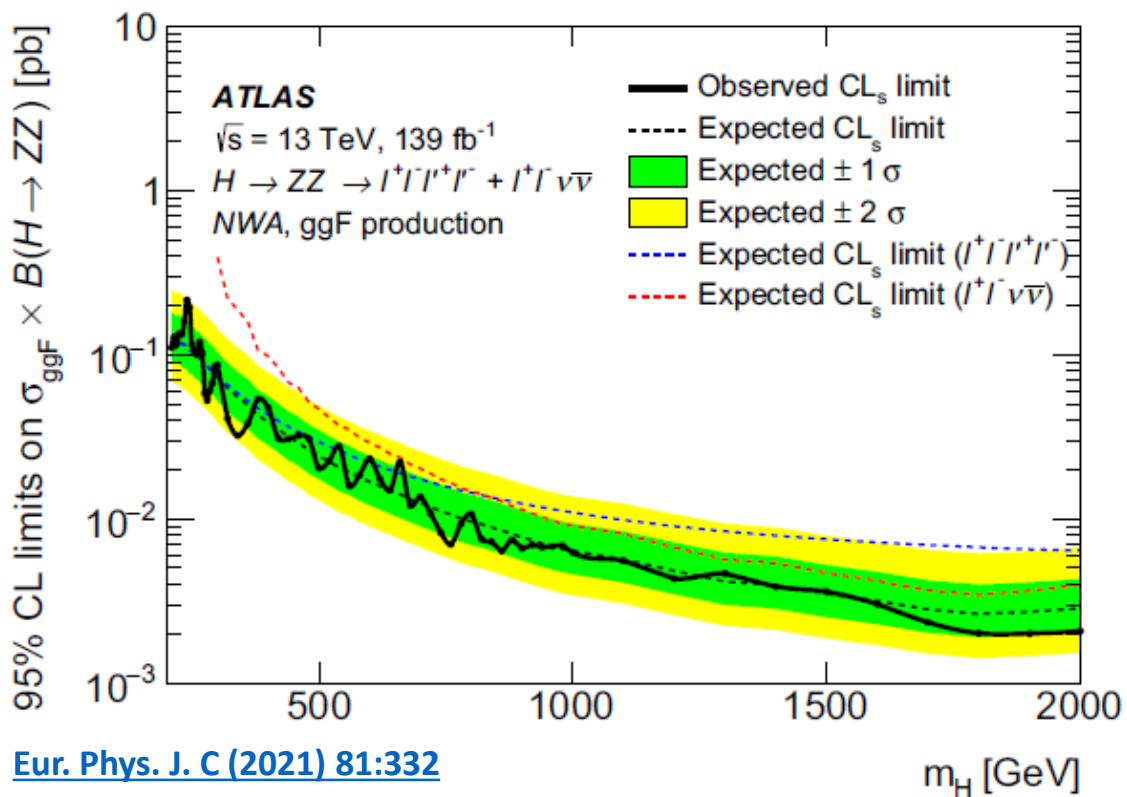

- Background from  $qq/gg \rightarrow ZZ$
- 4 leptons compatible with ZZ
- ggF and VBF category
- 2HDM and Graviton interpretations

- **2 Deep Neural Networks**

- Probe the ggF/VBF signal
- Trained on event kinematic variables
- Advanced design combining RNN and MLP
- 11 mass points (PNN)
- Separate events in ggF/VBF/rest

Eur. Phys. J. C (2021) 81:332

[Eur. Phys. J. C \(2021\) 81:332](#)

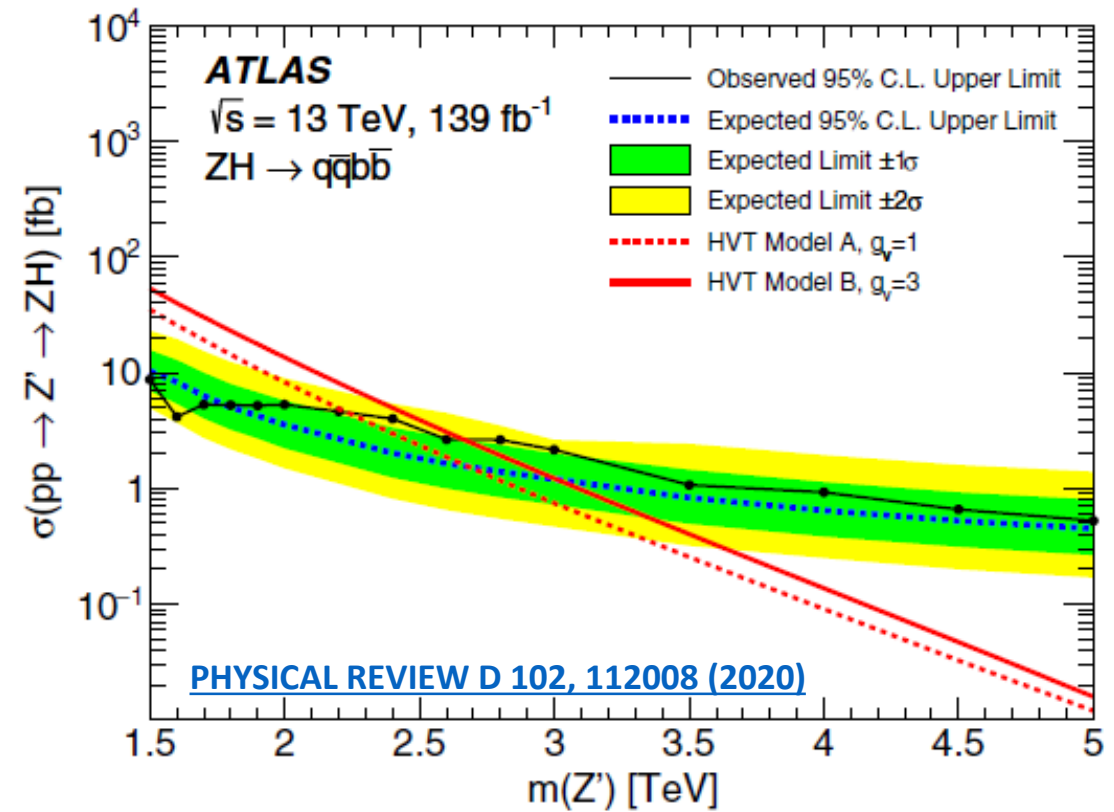

[arXiv:2211.02617v1](#)

Heavy Higgs  
 $H \rightarrow ZZ \rightarrow 4l/2l2\nu$

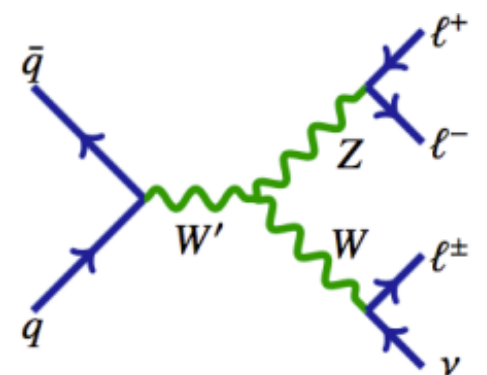

Heavy Higgs  
 $HW \rightarrow WWW \rightarrow l\nu l\nu jj$

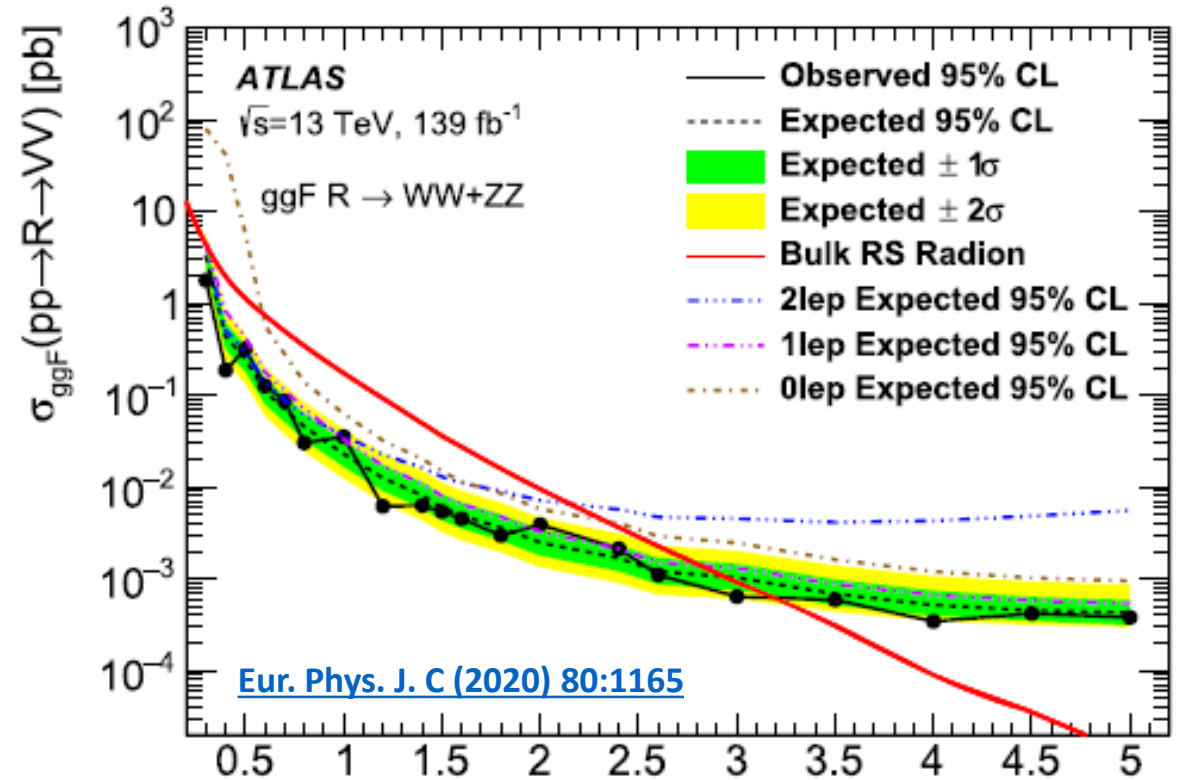

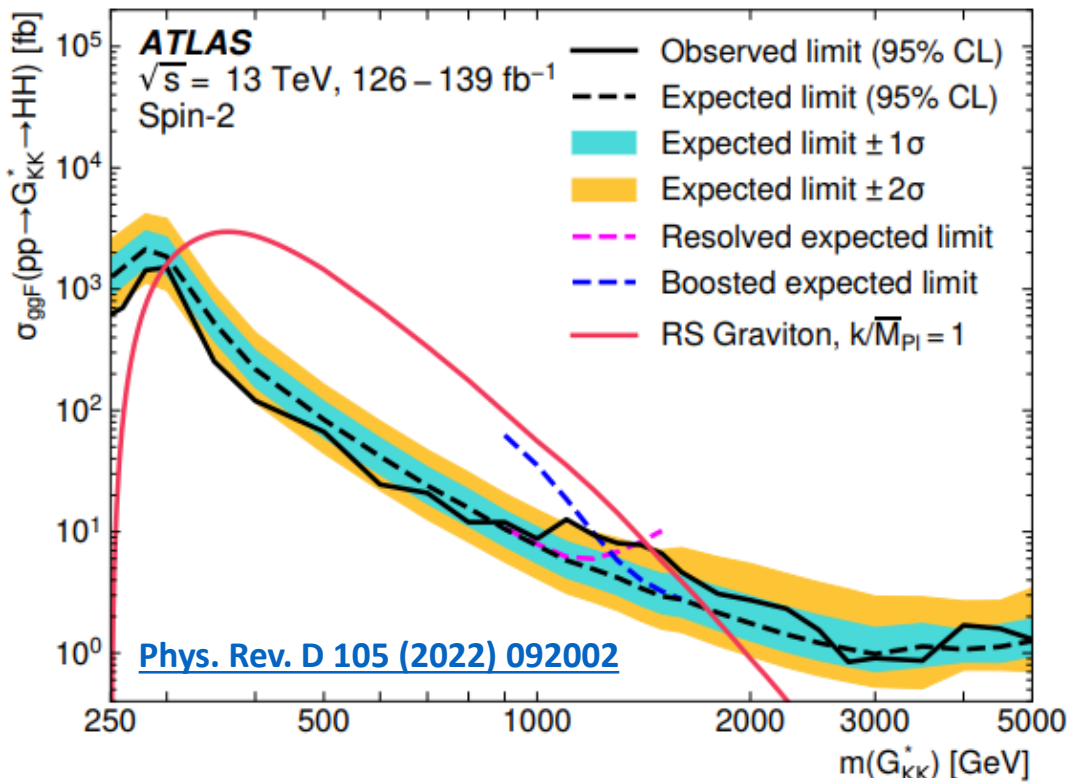

Heavy W  
 $W' \rightarrow WZ \rightarrow lll\nu$

Heavy Z  
 $Z' \rightarrow ZH \rightarrow qqbb$

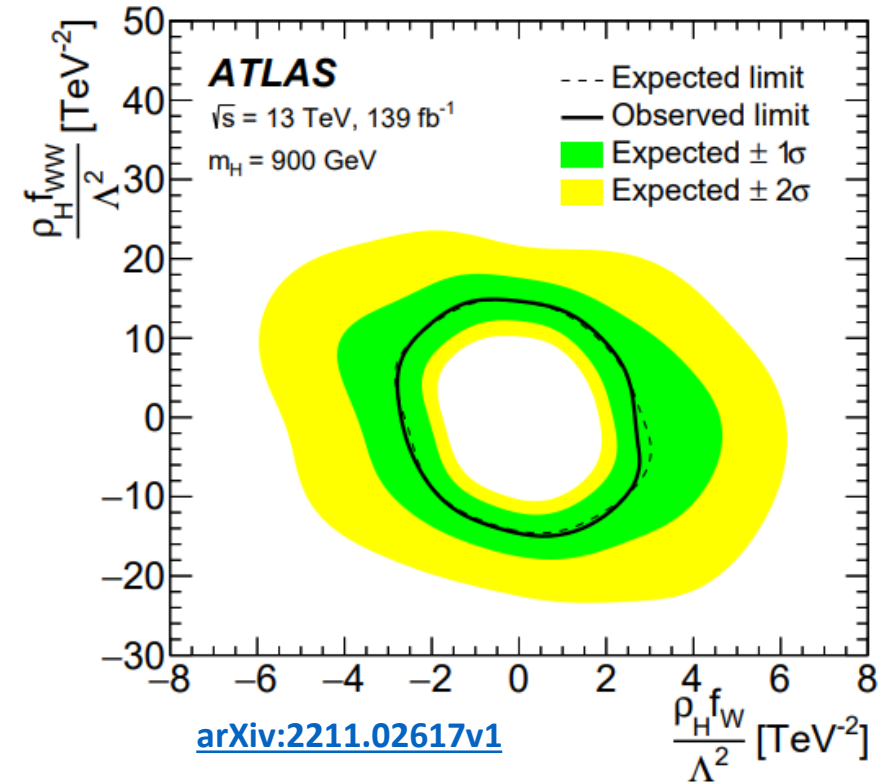

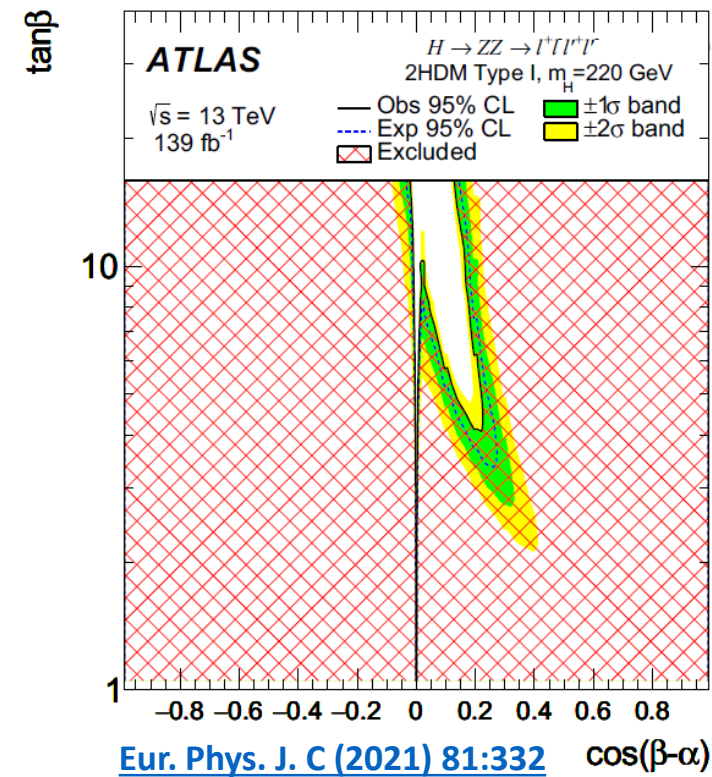

Graviton  
 $G \rightarrow HH \rightarrow b\bar{b}b\bar{b}$

Radion  
 $R \rightarrow VV \rightarrow qqll/\nu\nu/\nu\nu$

- **$H \rightarrow ZZ \rightarrow 4l$  (2HDM)**
  - Ratio of the vacuum expectation values of the 2 Higgs doublets ( $\tan\beta$ )
  - Mixing angle between the CP-even Higgs bosons ( $\alpha$ )
- **$W' \rightarrow WH \rightarrow qqbb$  (HVT)**
  - $W'$  – fermions coupling
  - $W'$  – Higgs coupling
- **$HW \rightarrow WWW \rightarrow l\nu l\nu jj$  (EFT)**
  - H anomalous couplings to W

- Many BSM predict new resonances
- Large variety of searches for Diboson Resonances by ATLAS
- Boosted jets final states are crucial
- Jet substructure and several new experimental techniques developed during Run II
- No significant excess so far
- Run III has already begun  
More exciting results !
