MINERvA Results in CH

Challenges

Neutrino flavors change

Neutrinos are produced in one of the three flavor eigenstates : e, μ, τ , but

travels as a mixture of mass eigenstates

 $|\nu_{\alpha}\rangle = \sum_{i} U^{*}_{\alpha i} |\nu_{\mathbf{i}}\rangle$

$$\begin{aligned} |\nu_{j}(t)\rangle &= e^{-i(E_{j}t - \vec{p}\vec{x})} |\nu_{j}(0)\rangle \\ &\approx e^{-i\left(\frac{m_{j}^{2}L}{2E}\right)} |\nu_{j}(0)\rangle \\ P_{\alpha \to \beta} &= \langle \nu_{\beta} | \nu_{\alpha} \rangle \\ &= \delta_{\alpha\beta} - 4\sum \mathcal{R}(U_{\alpha i}U_{\beta i}^{*}U_{\alpha j}^{*}U_{\beta j}) \sin^{2}\left(\frac{\Delta m_{ij}^{2}L}{4E}\right) + . \end{aligned}$$

Tejin Cai (York University)

MINERvA Results in CH

. .

L: Distance E: Energy Neutrino energy reconstruction is challenging

Neutrino energy needs to be reconstructed using observed reaction

Reconstruction detail depends on:

 detector physics – incomplete knowledge but controllable.

 \blacksquare nuclear physics – incomplete knowledge, and nature.

Quasi-elastic-like (QELike): only nucleons in the final states.

MINERvA Results in CH

Flux

Improving flux constraints

Tejin Cai (York University)

MINERvA Results in CH

LLWI 2023

Flux

Flux normalization: $\nu - e$ scattering

- ⓒ Flux is not known precisely
- ☺ Needs in-situ constraints
- $\textcircled{o} \quad \nu(\bar{\nu})e \to \nu(\bar{\nu})e \text{ is a standard} \\ \text{electroweak process with precisely} \\ \text{predicted cross section}$

- At $m_e \ll E_{\nu}$, electrons are very forward going
 - cannot calculate neutrino energy
- The total number of *ν* − *e* events provides strong constraint on the flux normalization

Flux

New result: improved constraint on NuMI flux

Joint constraint of $\nu(\bar{\nu})$ flux using

- **v**e scattering (Valencia et al., 2019²)
- inverse muon decay(Ruterbories et al., 2021³)
- **\overline{\nu}e** scattering (Zazuesta eta al., 2022¹)

Tejin Cai (York University)

MINERvA Results in CH

Type	uncertainty improvement
ν_{μ} flux	$7.6\% \rightarrow 3.3\%$
$\bar{\nu}_{\mu}$ flux	$7.8\% \rightarrow 4.7\%$

LLWI 2023

Results in CH: ν triple differential QELike cross section

 ν in CH

Ruterbories et al., 2022^4

Muon p_{\parallel} vs muon p_T vs total proton KE $(\sum T_p)$

First high statistics triple differential measurement.

Expose nuclear effects with lepton-hadron correlation

Culprits of discrepancies can be traced.

QELike: 1 muon and no mesons in the final states

Tejin Cai (York University)

MINERvA Results in CH

LLWI 2023

Results in CH: $\bar{\nu}$ high statistics QELike cross section

 $\bar{\nu}$ in CH

 $\bar{\nu}$ in CH

Bashyal et al.,2022⁵

Muon p_{\parallel} vs muon p_T

QELike: 1 μ^+ , no mesons, no protons with $T_p > 120 \text{ MeV}$

General disagreement between data and MC, especially at high muon p_T . $p_T \sim$ momentum transfer, linked to Q^2 . Dominated by QE.

Muon Transverse Momentum (GeV/c)

Tejin Cai (York University)

MINERvA Results in CH

LLWI 2023

$\bar{\nu}$ in CH

Muon p_{\parallel} vs muon p_T

QELike: 1 μ^+ , no mesons, no protons with $T_n > 120 \text{ MeV}$

General disagreement between data and MC. especially at high muon $p_T \sim \text{momentum transfer},$ linked to Q^2 .

Muon Transverse Momentum (GeV/c)

Ratio to MINERvA Tune v1

Tejin Cai (York University)

MINERvA Results in CH

LLWI 2023

13/17

Bashval et al., 2022^5

Cross section ratio in terms of Q^2

Bashyal et al., 2022^5

 μ^+ , no mesons, no protons with $T_p > 120 \text{ MeV}$

- Q^2 : inverse of 4-momentum transfer squared.
 - Ratio of data and models to some reference model.
 - Some models agree better than others.
 - We could gain more information with lepton-hadron correlations.

Results in CH: with neutron correlation: charged current elastic $\bar{\nu}$ -proton cross section

 $\bar{\nu}$ in CH

Nucleon and nuclear effects from charged current (CC) interactions

Quasi-elastic-like (QELike): only nucleons in the final states.

Tejin Cai (York University)

MINERvA Results in CH

QELike: $\bar{\nu}$ scattering on free proton

Neutron reconstruction:

- measures neutron point of interaction,
- derive neutron direction,
- potentially separate H and C from hydrocarbon

Cai et al., 2023^6

$\bar{\nu}$ QELike with neutrons

MINERvA Results in CH

LLWI 2023

MINER ν A's hydrocarbon target has yielded many important measurements over the last year.

- Pushing the boundary of precision neutrino measurements in
 - understanding of flux
 - diagnosis of nuclear models
 - measuring free proton cross section on CH for the first time
- There are more lepton-hadron correlation measurements in the pipeline. Please stay tuned!

LLWI 2023

Sensitivities to Many Final States

- MINER \nu A's plastic scintillators are sensitive to small energy deposits
- Hadronic recoils are measured from calorimetry
- Tracking threshold (KE) for proton is ~ 100MeV
- Neutrons can deposit visible energies (albeit small) after recoil inside scintillator

Created different angular regions – Hydrogen signal in the center. Outer regions are used for fit and validation – expand each region in Q^2

Tejin Cai (York University)

MINERvA Results in CH

Predicted hydrogen angles – concentrated in the center.

Tejin Cai (York University)
