Talk by A.S.Vera at LHeC Workshop 2008

Summary of LHeC Physics [arXiv:1211:4831+5102]

The LHeC represents a new laboratory for exploring a hugely extended region of phase space with an unprecedented high luminosity in high energy DIS. It builds the link to the LHC and a future pure lepton collider, similar to the complementarity between HERA and the Tevatron and LEP, yet with much higher precision in an extended energy range. Its physics is fundamentally new, and it also is complementary especially to the LHC, for which the electron beam is an upgrade. Given the broad range of physics questions, there are various ways to classify these, partially overlapping. An attempt for a schematic overview on the LHeC physics programme as seen from today is presented in Tab. 3. The conquest of new regions of phase space and intensity has often lead to surprises, which tend to be difficult to tabulate.

QCD Discoveries	$\alpha_s < 0.12$, $q_{sea} \neq \overline{q}$, instanton, odderon, low x: (n0) saturation, $\overline{u} \neq \overline{d}$
Higgs	WW and ZZ production, $H \to b\overline{b}$, $H \to 4l$, CP eigenstate
Substructure	electromagnetic quark radius, e^*, ν^*, W?, Z?, top?, H?
New and BSM Physics	leptoquarks, RPV SUSY, Higgs CP, contact interactions, GUT through α_s
Top Quark	top PDF, $xt = x\overline{t}$?, single top in DIS, anomalous top
Relations to LHC	SUSY, high x partons and high mass SUSY, Higgs, LQs, QCD, precision PDFs
Gluon Distribution	saturation, $x \approx 1$, J/ψ, Υ, Pomeron, local spots?, F_L, F_2^c
Precision DIS	$\delta\alpha_s \simeq 0.1\,\%$, $\delta M_c \simeq 3\,\text{MeV}$, $v_{u,d}$, $a_{u,d}$ to $2-3\,\%$, $\sin^2\Theta(\mu)$, F_L, F_2^b
Parton Structure	Proton, Deuteron, Neutron, Ions, Photon
Quark Distributions	valence $10^{-4} \lesssim x \lesssim 1$, light sea, d/u, $s = \overline{s}$?, charm, beauty, top
QCD	N^3LO, factorisation, resummation, emission, AdS/CFT, BFKL evolution
Deuteron	singlet evolution, light sea, hidden colour, neutron, diffraction-shadowing
Heavy Ions	initial QGP, nPDFs, hadronization inside media, black limit, saturation
Modified Partons	PDFs "independent" of fits, unintegrated, generalised, photonic, diffractive
HERA continuation	F_L, xF_3, $F_2^{\gamma Z}$, high x partons, α_s, nuclear structure, ..

Table 3: Schematic overview on key physics topics for investigation with the LHeC.

What HERA could not do or has not done

Test of the isospin symmetry (u-d) with eD - no deuterons
Investigation of the q-g dynamics in nuclei - no time for eA
Verification of saturation prediction at low x – too low s
Measurement of the strange quark distribution – too low L
Discovery of Higgs in WW fusion in CC – too low cross section
Study of top quark distribution in the proton – too low s
Precise measurement of F_L – too short running time left
Resolving d/u question at large Bjorken x – too low L
Determination of gluon distribution at hi/lo x – too small range
High precision measurement of α_s – overall not precise enough
Discovering instantons, odderons – don't know why not
Finding RPV SUSY and/or leptoquarks – may reside higher up
…

ECFA Review 2007-2012

CERN SPC, [r]ECFA Mandate given in 2007 to work out the LHeC physics, detector and accelerator design(s) – looking back to 1994 CDR and referee process carefully evaluated by ECFA committee

… We believe that such a comparison is desirable to promote the LHeC physics case by highlighting the uniqueness of its physics programme, and by viewing it in a larger context of physics at the frontiers of highest energy, highest precision and highest densities.

Stressed: Link to LHC physics and operation, link to HEP, cost estimates, R&D, DIS community

It is our opinion that only the linac-ring option is viable. We point out that there are still important issues to be addressed concerning the physics potential, the accelerator and the detector.

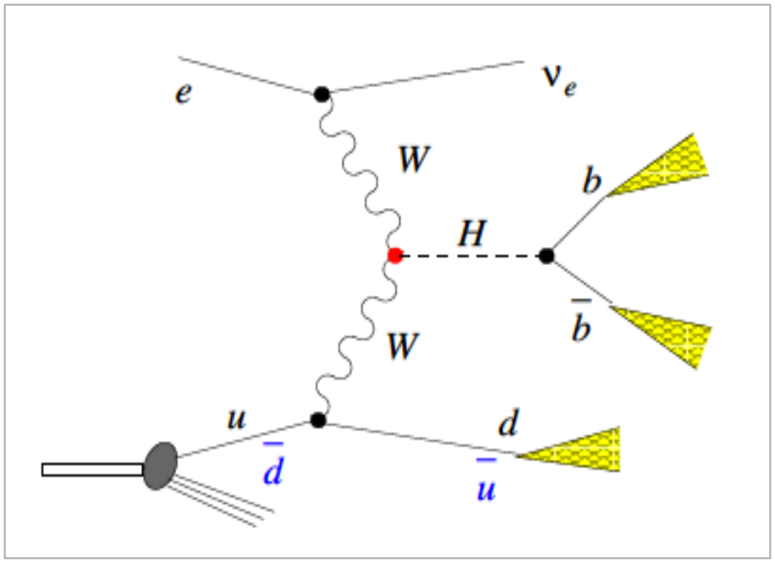
We regard the design effort carried out on the machine as very valuable also for other projects.

Most important is to assemble a strong community in particle and nuclear physics to push further this challenging project, and to secure resources for the ensuing R&D projects towards the formulation of a TDR.

ECFA Statement ECFA/12/279 December 2012

Higgs at the LHeC

LHeC is a Higgs "Factory": 200 fb cross section in CC e^-p: L= 1 ab^{-1}: 2 10^5 Higgs events
Clean final state, no pile-up, low QCD bgd, uniquely WW and ZZ, small theory unc.ties



LHeC Higgs	CC (e^-p)	NC (e^-p)	CC (e^+p)
Polarisation	-0.8	0	0
Luminosity [ab^{-1}]	1	1	0.1
Cross Section [fb]	196	20	58
Acceptance	0.92	0.93	0.94
Decay Channel	N^H_{CC} e^-p	N^H_{NC} e^-p	N^H_{CC} e^+p
$H \to b\bar{b}$	117 500	12 000	3500
$H \to c\bar{c}$	5 900	600	180
$H \to gg$	16 200	1 600	480
$H \to WW$	25 200	2 600	760
$H \to ZZ$	2 880	1900	560
$H \to \tau^+\tau^-$	10 260	1 000	310
$H \to \gamma\gamma$	360	40	12

Ultimate e and p beams, 10 years of operation

Table 1: Cross sections and rates of Higgs production in ep scattering with the LHeC. The cross sections are obtained with MADGRAPH5 (v1.5.4) using the p_T of the scattered quark as scale, CTEQ6L1 partons and $M_H = 125\,\text{GeV}$. The acceptance is obtained with kinematic cuts on final state particles ($|\eta_{jet}| < 5$, $|\eta_{e,\gamma}| < 4.7$, $p_{T,jet} > 1\,\text{GeV}$, $E_{jet} > 15\,\text{GeV}$, $E'_e > 10\,\text{GeV}$, $E_\gamma > 5\,\text{GeV}$) but excludes the tagging probabilities for b, c, τ and further g, W, Z reconstruction efficiencies. In an initial study (CDR) the $b\bar{b}$ final state is reconstructed with an efficiency of about 5 %. This leads to $\simeq$ 5000 events in this channel, at an S/N of 1.

ILC: 10^{34} $cm^{-2}s^{-1}$, 280fb, 15000 cavities, width - LHeC: 10^{34} 200fb 960 cavities, no width

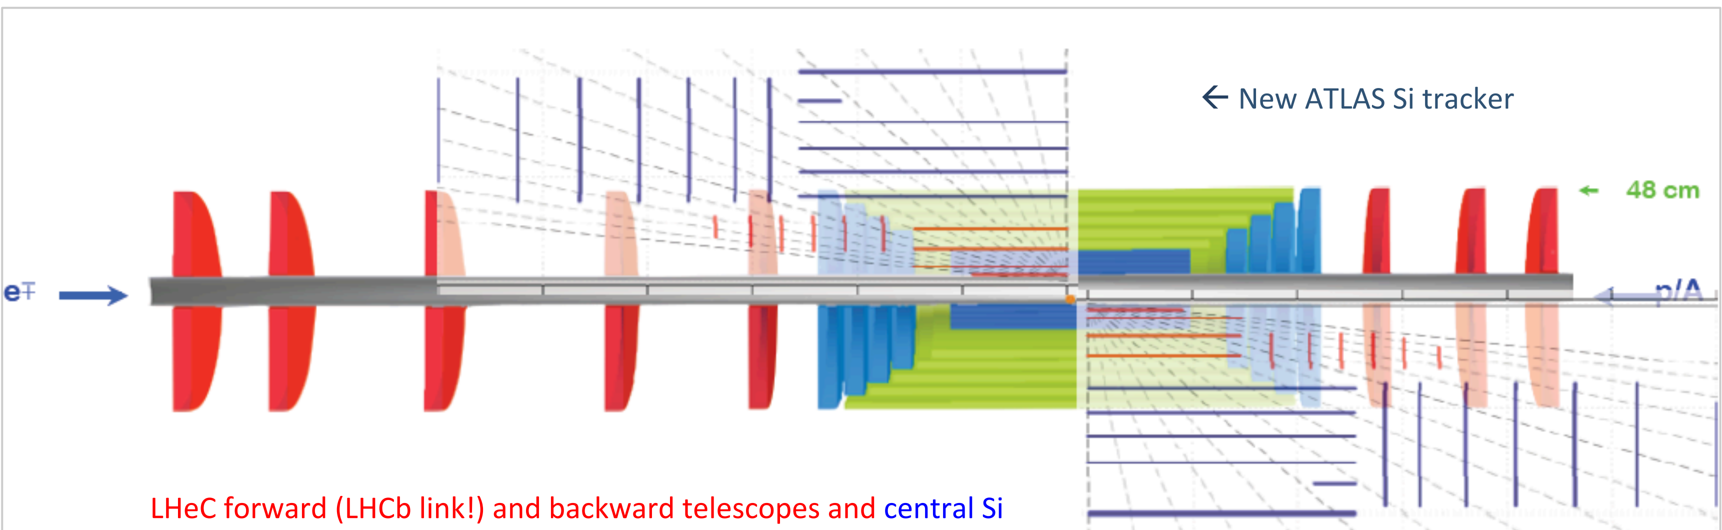
UK and the LHeC

Slide shown to PPAP
9/2013

… the UK has played a leading role in the initialisation and design of the LHeC concepts, convenors, ideas, advisory board, 4 members and chair of the LHeC steering committee since 2007. For example, out of 5 talks at ICHEP on the LHeC, partially very visible (cf DG ICHEP slides on LHeC and Higgs), 3 had been given by UK physicists. The presentation at Cracow was awarded to P Newman…

By now, 5 UK Universities have worked on or expressed a serious interest in the detector development (Birmingham, Lancaster, Liverpool, Manchester, QMW), also nuclear physics groups from various (UK) institutes as the LHeC links PP with NP in a unique way. It also relates to ATLAS activities (interest in tracking and trigger developments, cf ongoing upgrade preparations).



LHeC: no pile-up, less radiation, smaller momenta apart from forward region

SoI to come in due time, consultations with STFC, and UK community

UK Accelerator Engagement

Slide shown to PPAP
9/2013

Topics of joint interest and priority
Meeting ASTEC/CI 5.9.12 at CERN

Deepa Angal-Kalinin[1], Robert Appleby[5], Ian Bailey[3], Steve Buckley[1], Graeme Burt[3], Neil Bliss[2], Swapan Chattopadhyay[3,4,5], Jim Clarke[1], Peter Corlett[1], Philippe Goudket[1], Andy Goulden[1], Joe Herbert[1], Kai Hock[4], Frank Jackson[1], Steve Jamison[1], James Jones[1], Lee Jones[1], Alexander Kalinin[1], Oleg Malyshev[1], Neil Marks[1], Peter McIntosh[1], Julian McKenzie[1], Keith Middleman[1], Boris Militsyn[1], Andy Moss[1], Bruno Muratori[1], David Newton[4], Tim Noakes[1], Shrikant Pattalwar[1], Yuri Saveliev[1], Ben Shepherd[1], Susan Smith[1], Rob Smith[1], Trina Thakker[1], Luke Thompson[5], Reza Valizadeh[1], Carsten Welsch[4], Alan Wheelhouse[1], Peter Williams[1], Andy Wolski[4]

Electron source for TF

Design of IR, Optics for p beams, synrad tracking

Test facility design (OPAC fellow)

Sc cavity design, coupler, HOM damper, tuner..

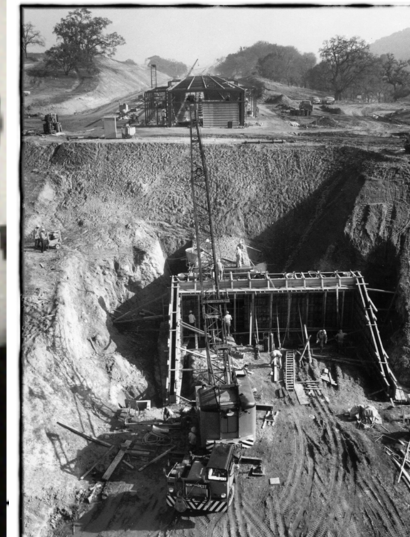
Instrumentation for TF…

With only somewhat reduced priority: beam dynamics, positron source, magnets ..

Preparation of MoU, with view also to other partners

The LHeC represents a unique opportunity for the Daresbury Campus (ASTEC and CI), but also for the wider UK accelerator community (A.Seryi co-author of CDR) to be at the forefront of accelerator developments, building on their unique expertise, a very welcome strong expression of interest, and its strong links to Universities, CERN and industry.

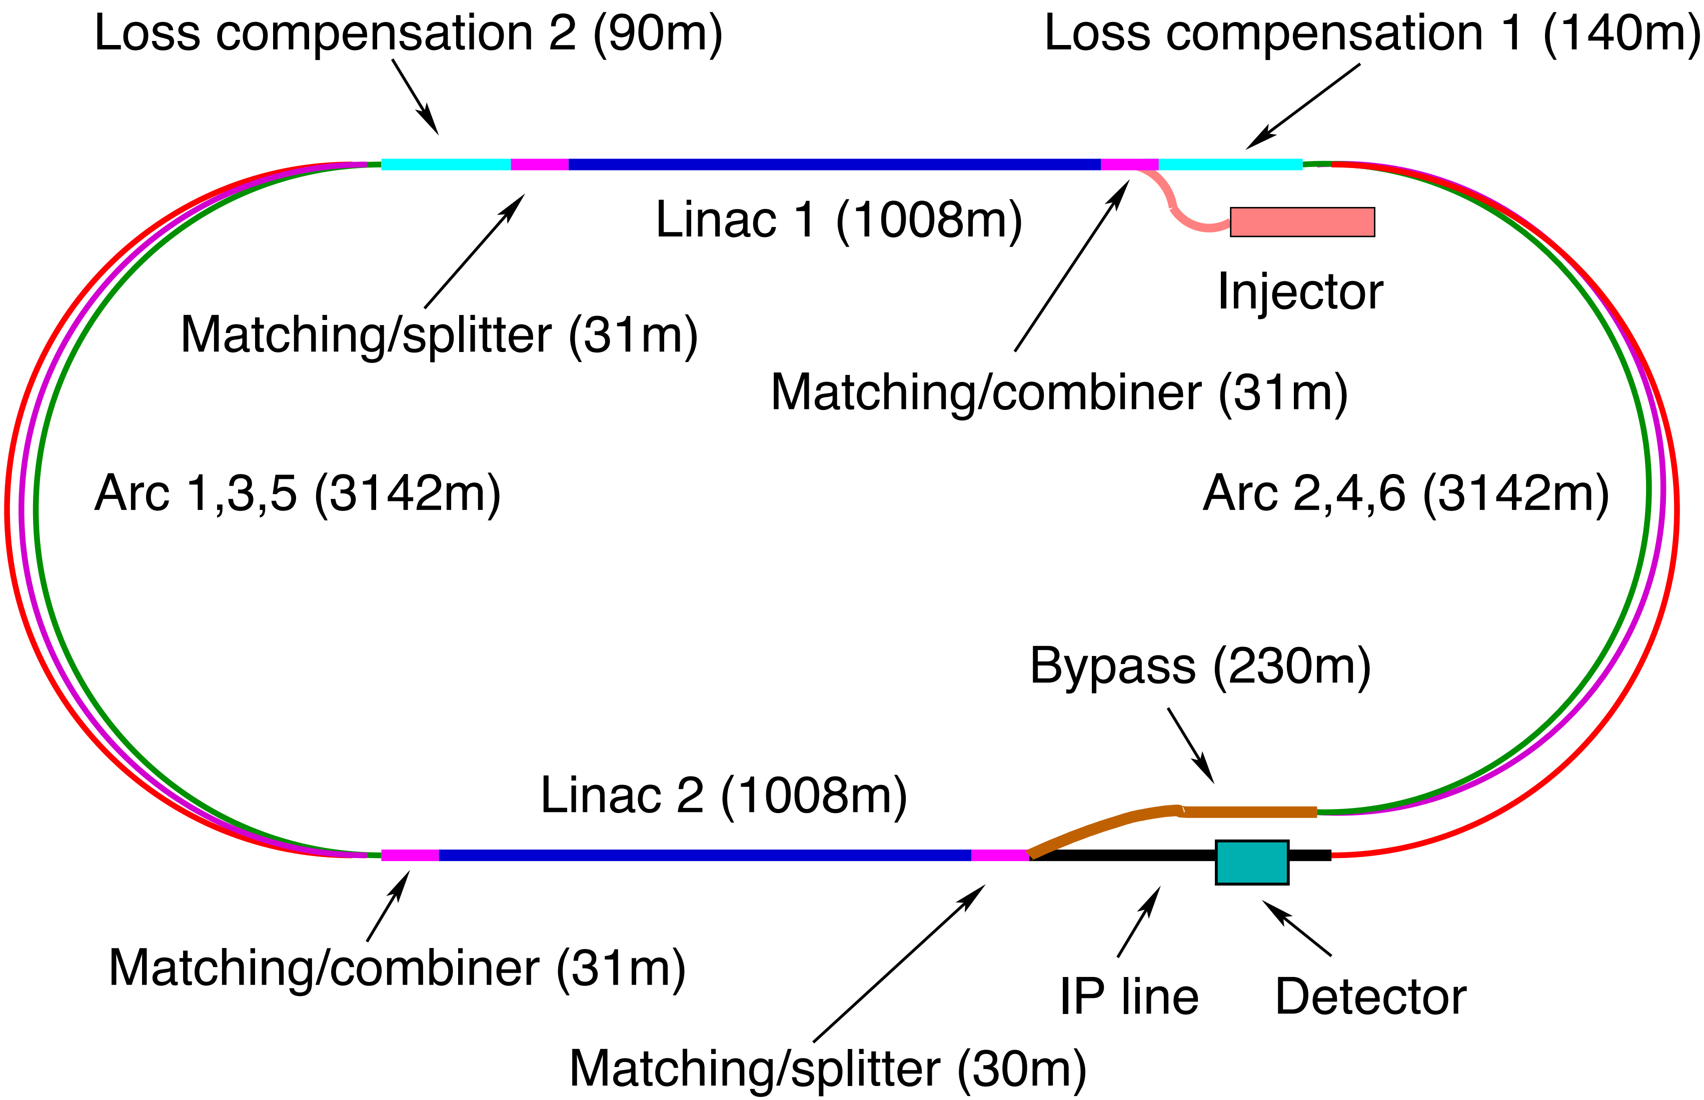
can one build a 2-3-km long linac?



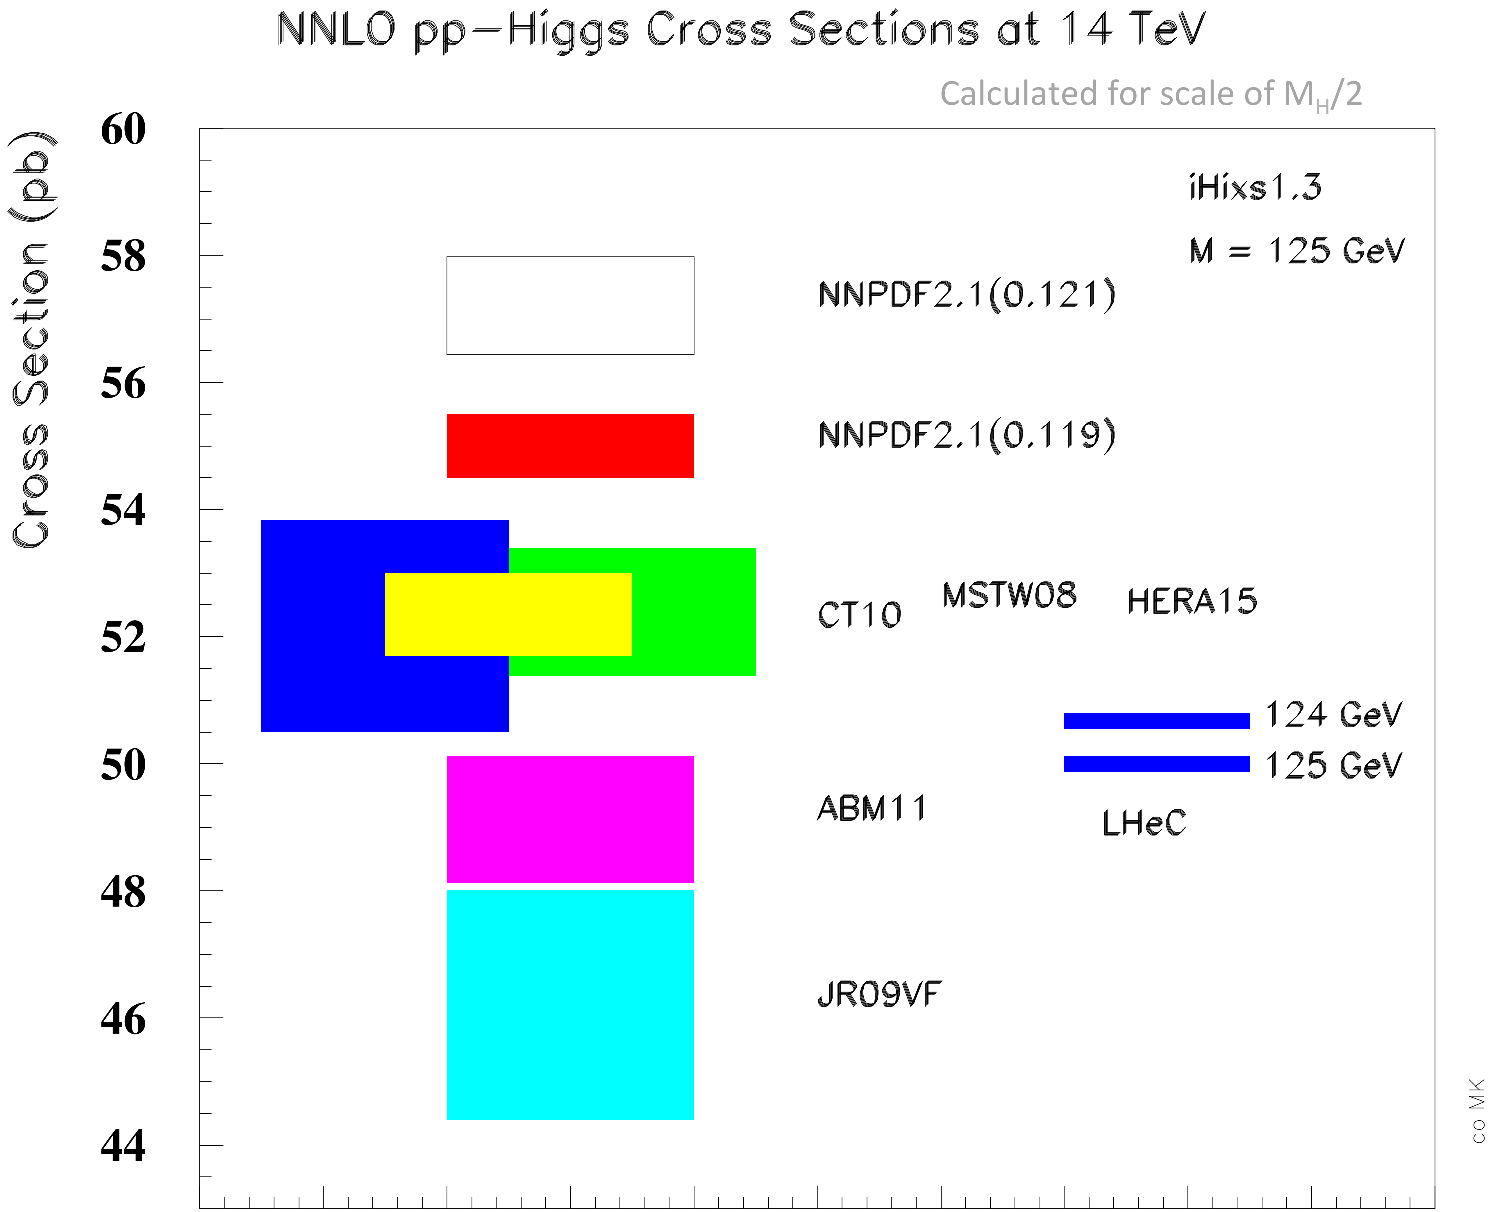
it has been done before

Courtesy F.Zimmermann

Backup



60 GeV electron beam energy, L= 10^{33} $cm^{-2}s^{-1}$, $\sqrt{s}$=1.3 TeV: Q^2_{max}= 10^6 GeV^2, $10^{-6} < x < 1$
Recirculating linac (2 * 1km, 2*60 cavity cryo modules, 3 passes, energy recovery)
Ring-ring as fall back. “SAPHIRE” 4 pass 80 GeV option to do mainly: $\gamma\gamma \rightarrow H$



Exp uncertainty of LHeC Higgs cross section is 0.25% (sys+sta), using LHeC only.

Leads to mass sensitivity..

Strong coupling underlying parameter (0.005 – 10%). LHeC: 0.0002

Needs N^3LO

HQ treatment important

PRECISION σ(H)

Higgs production (gg) at the LHC is $\propto \alpha_s^2(M_H^2) xG(x, M_H^2) \otimes xG(x, M_H^2)$

Bandurin (ICHEP12) Higgs physics at the LHC is limited by the PDF knowledge

1. Chavannes Workshop

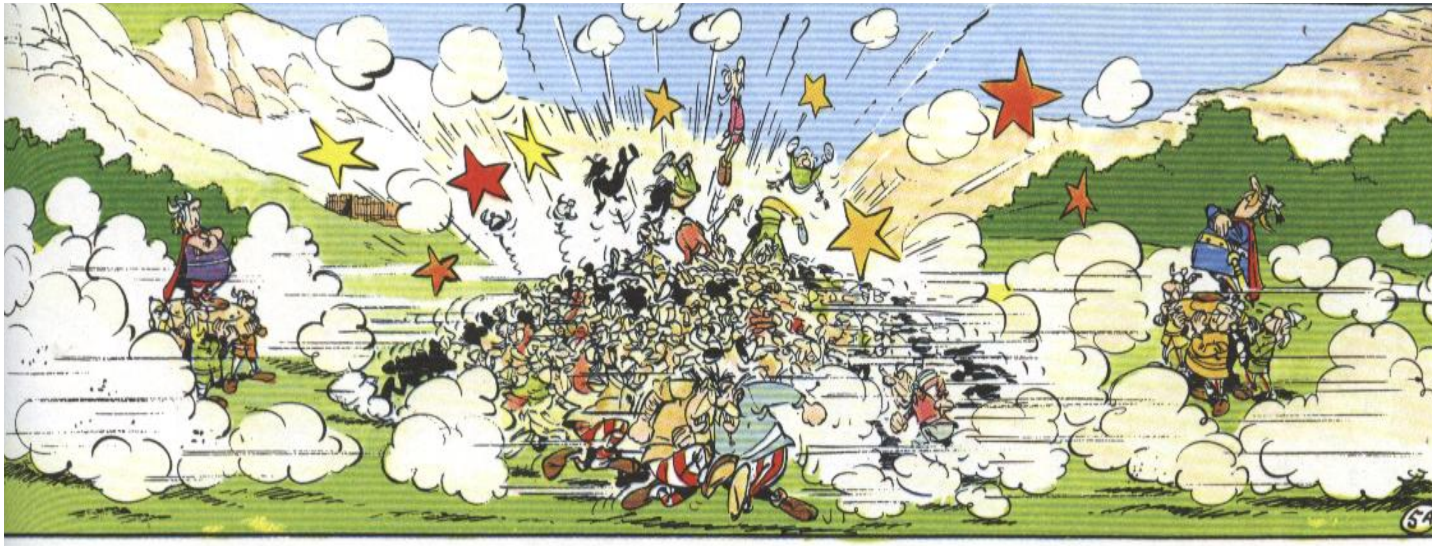
4th in the series of LHeC Workshops
(2008,2009, 2010,2012)

Next workshop tentatively 14/15.10.2013

Concluding Remarks

From HERA to the LHeC

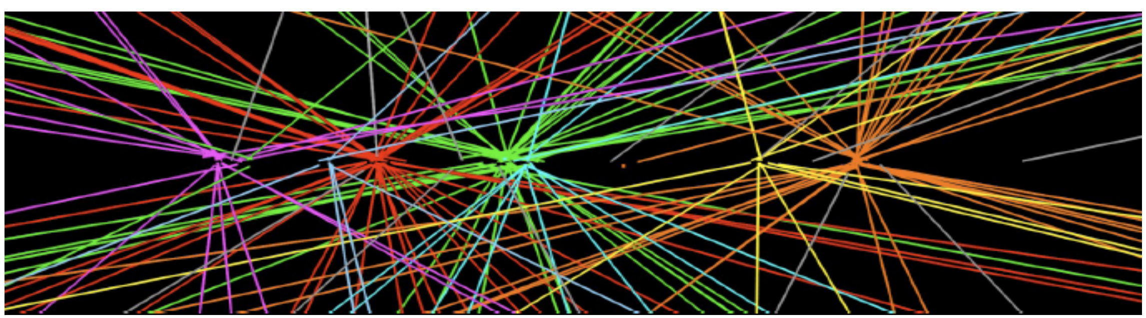
LHC forward look



Mean pileup about 10 at L ~ $10^{33}cm^{-2}s^{-1}$

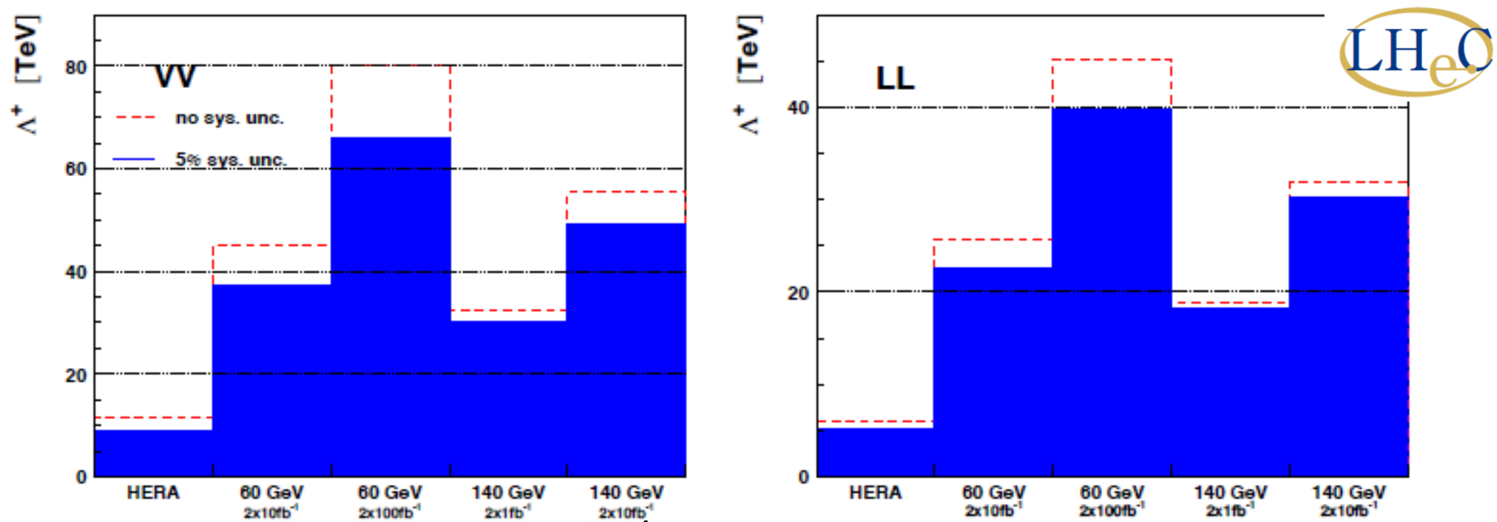
Upgrades as of the ATLAS tracker for 5 10^{34} are major undertaking of HEP

ep/eA will provide possibly crucial information for new physics and high precision.

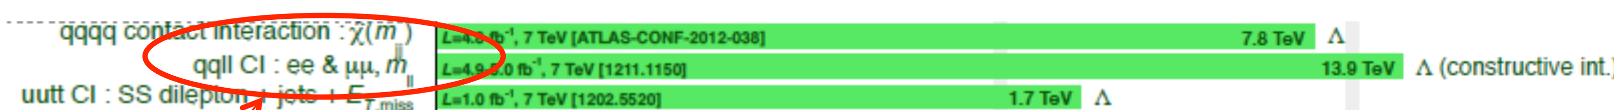


Contact interactions (eeqq)

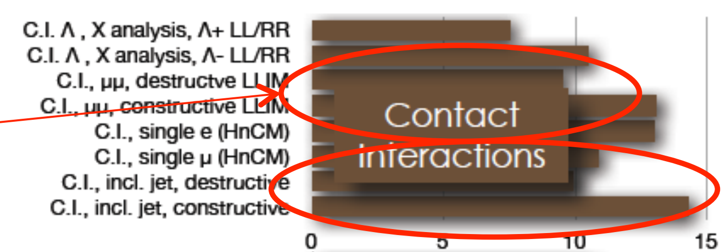
- New currents or heavy bosons may produce indirect effect via new particle exchange interfering with γ/Z fields.
- Reach for Λ (CI eeqq): 25-45 TeV with 10 fb^{-1} of data depending on the model



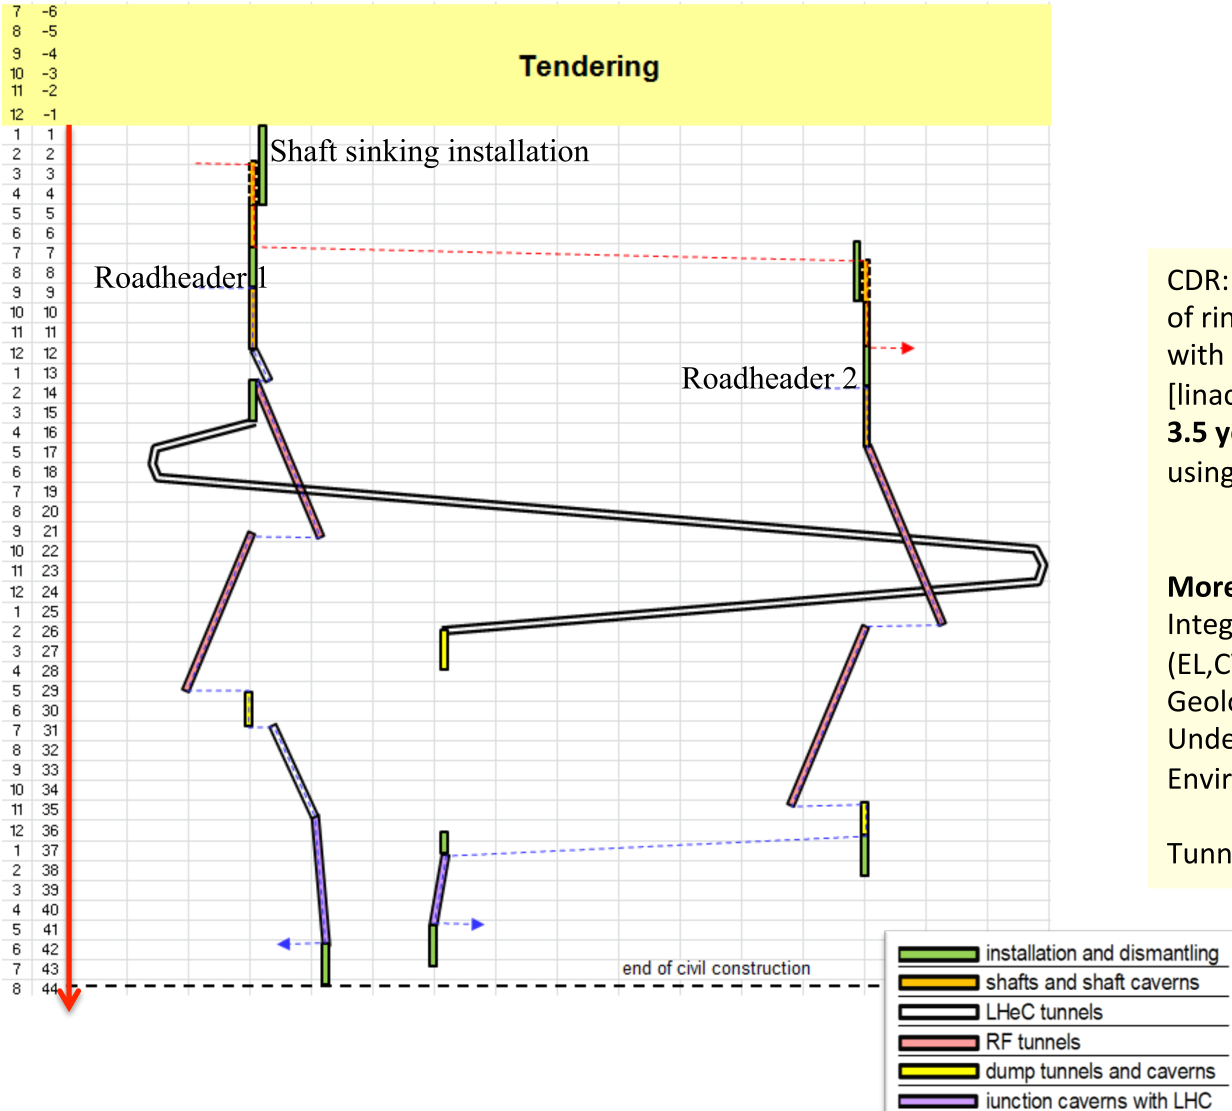
Similar to LHC



ATLAS and CMS constraints on eeqq CI (expected up to 30-40 TeV at c.o.m. 14 TeV LHC)



Civil Engineering



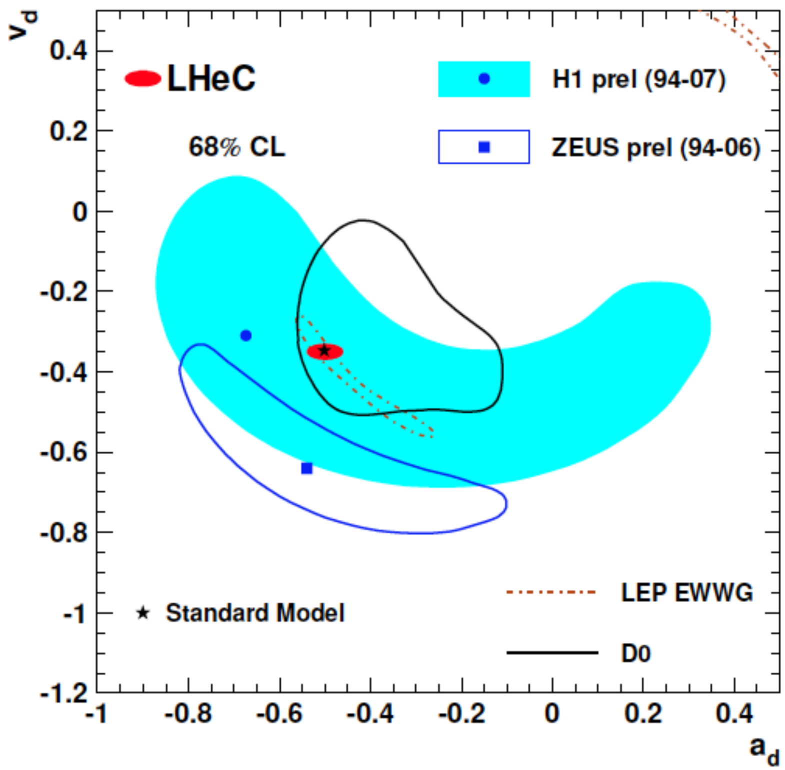
CDR: Evaluation of CE, analysis of ring and linac by Amber Zurich with detailed cost estimate [linac CE: 249,928 kSF..] and time: **3.5 years for underground works** using 2 roadheaders and 1 TBM

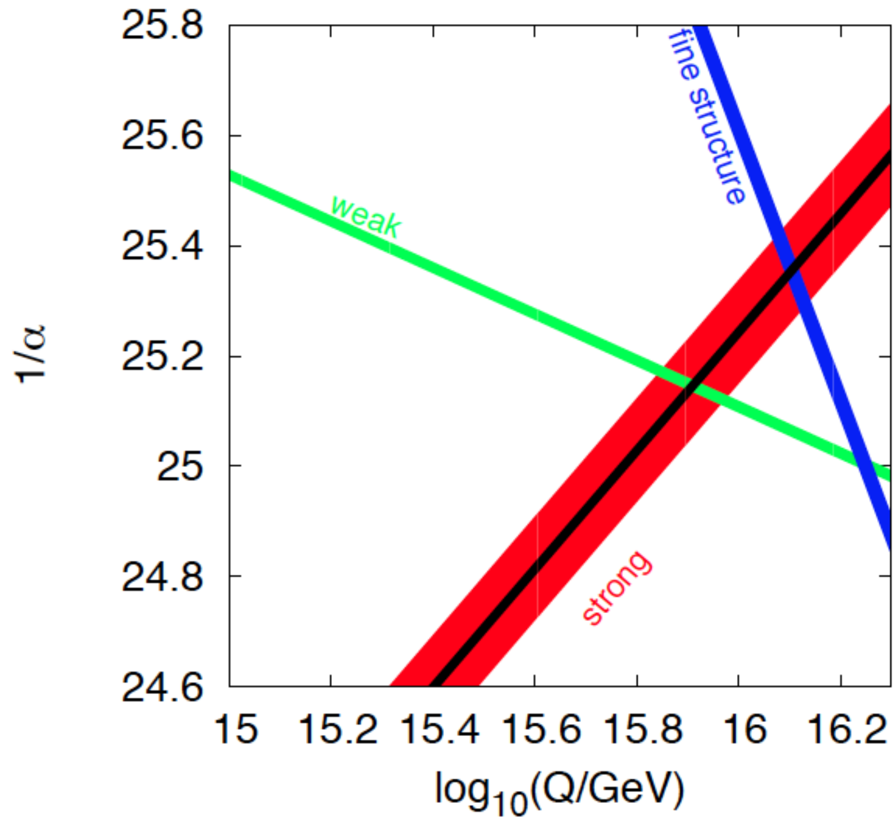
More studies needed for
Integration with all services (EL,CV, transport, survey etc).
Geology
Understanding vibration risks
Environmental impact assessment

Tunnel connection in IP2

J.Osborne, Chavannes

High Precision DIS



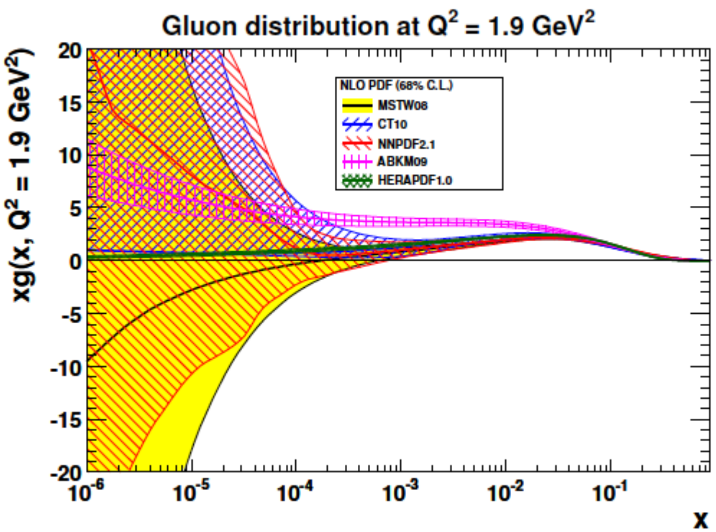


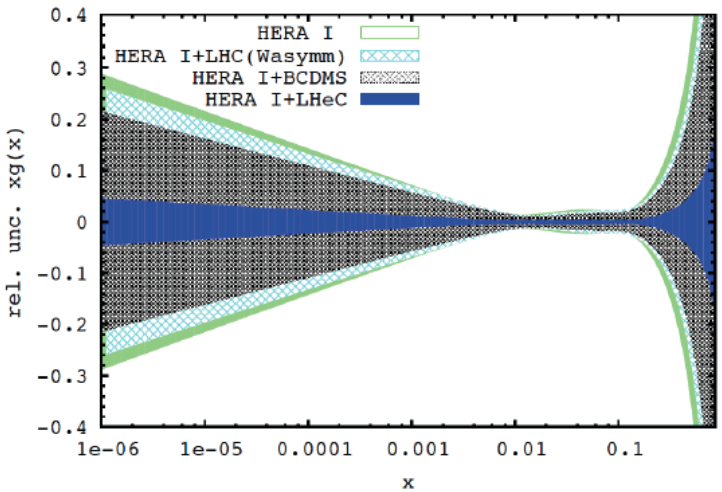
$Q^2 >> M_{Z,W}^2$, high luminosity, large acceptance
Unprecedented precision in NC and CC
Contact interactions probed to 50 TeV
Scale dependence of $\sin^2\theta$ left and right to LEP

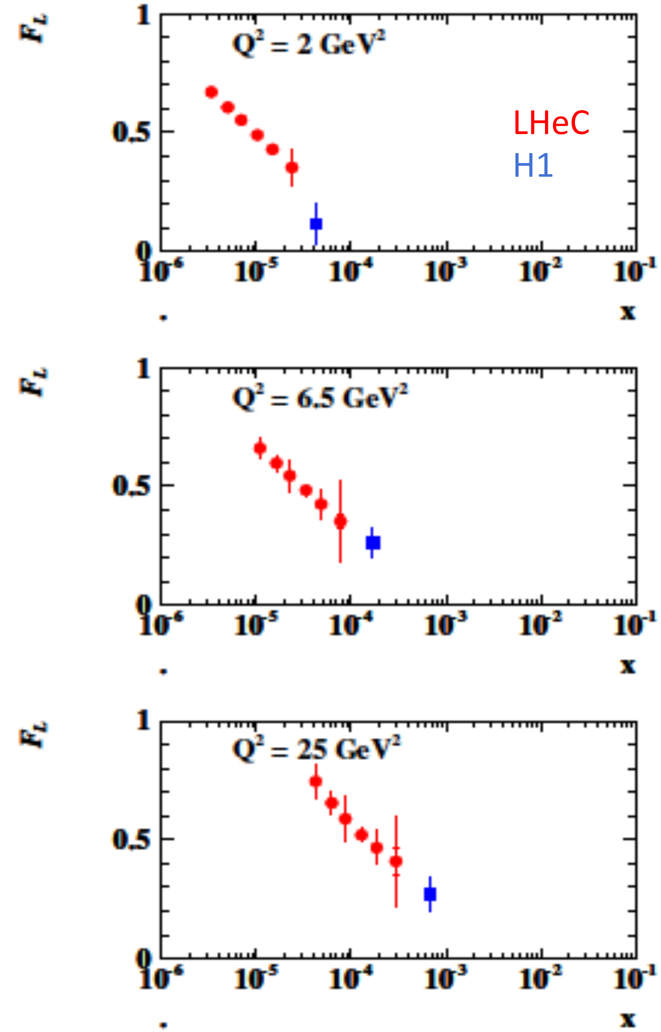
→ A renaissance of deep inelastic scattering ←

Solving a 30 year old puzzle:
α_s small in DIS or high with jets?
Per mille measurement accuracy
Testing QCD lattice calculations
Constraining GUT (CMSSM40.2.5)
Charm mass to 3MeV, N^3LO

Gluon Saturation at Low x?



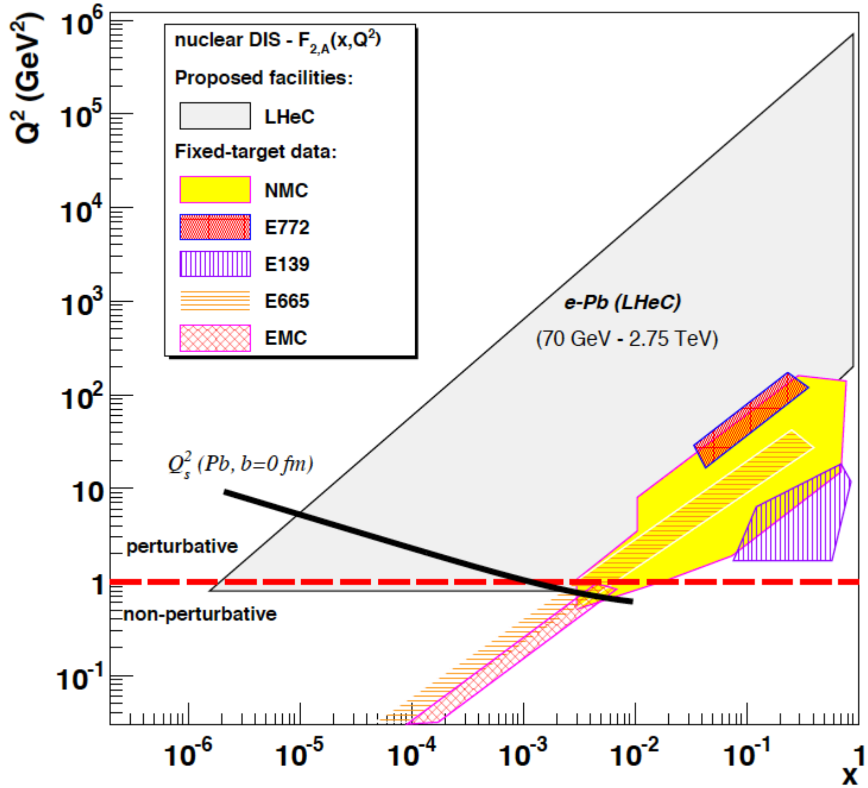


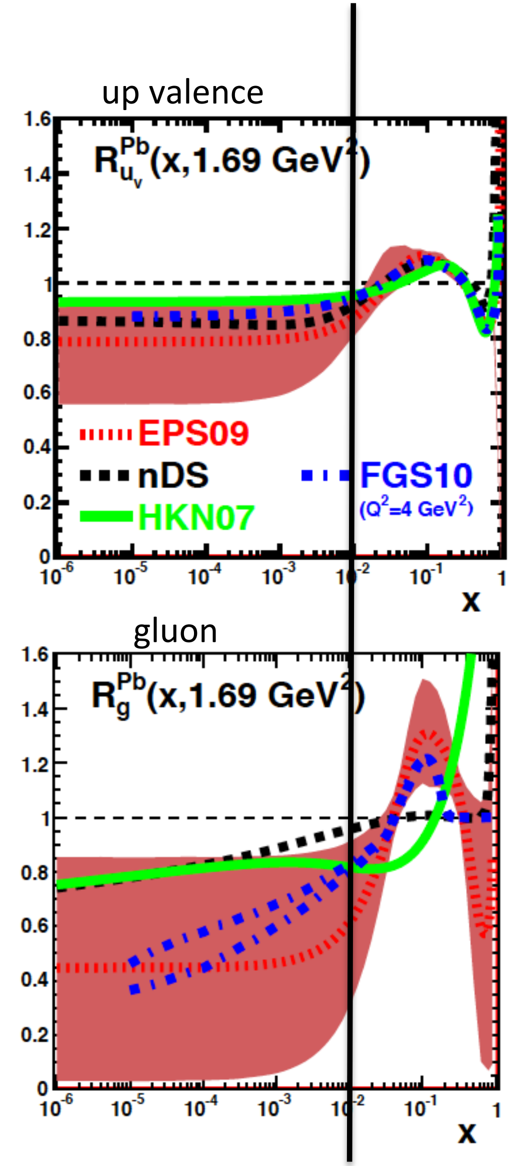


Gluon measurement down to $x=10^{-5}$, **Saturation or no saturation** (F_2 and precise F_L)
Non-linear evolution equations? Relations to string theory, and **SUSY at ~10 TeV**?

cf H.Kowalski, L.Lipatov, D.Ross, arXiv:1205.6713

Heavy Ion Physics





eA physics is essentially not done yet (no eA at HERA)
LHeC has huge discovery potential for new HI physics
(bb limit, saturation, deconfinement, hadronisation..)
It will put nPDFs on completely new ground and constrain the initial conditions of the Quark-Gluon Plasma

unmeasured | known?

3. Higgs Discovery

$$L = (D_\mu \phi)^+ (D_\mu \phi) - V(\phi^+ \phi) - \frac{1}{4} F^a_{\mu\nu} (F^a)^{\mu\nu} - \frac{1}{4} G_{\mu\nu} G^{\mu\nu}$$

$$D_\mu = (\partial_\mu + igA^a_\mu \frac{\varepsilon_a}{2} + ig' B_\mu \frac{1}{2}), \phi = \begin{pmatrix} 0 \\ \eta + \sigma(x)/\sqrt{2} \end{pmatrix}$$

$$M_{W^+} = M_{W^-} = \frac{g\eta}{\sqrt{2}}$$

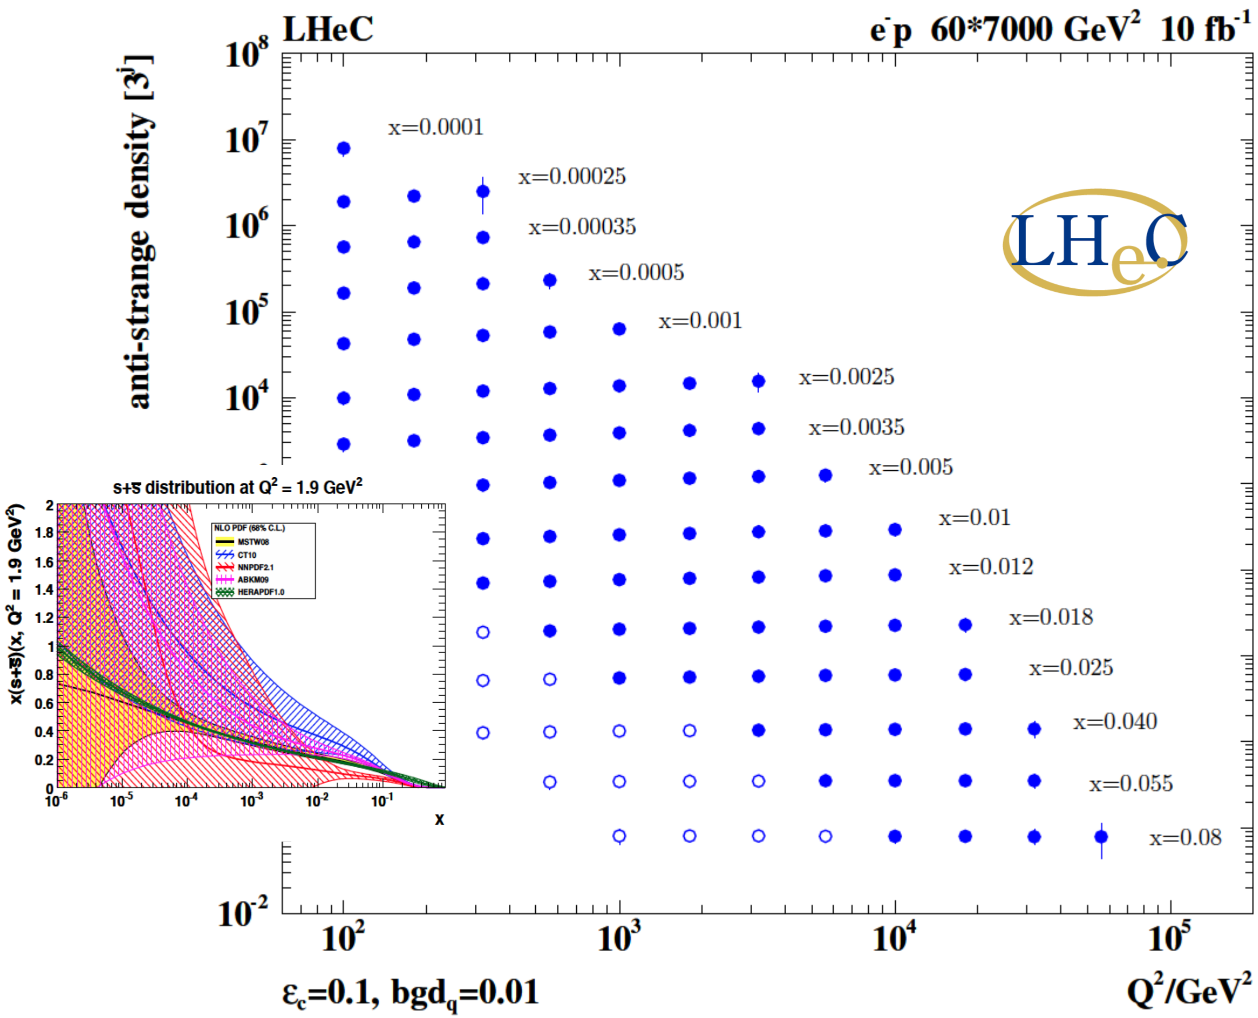
$$M_Z = \frac{M_W}{\cos\theta}$$

$$M_\gamma = 0$$

$$M_H = \sqrt{-2\mu^2} = 2\eta \cdot \sqrt{\lambda}$$

Higgs was studied in CDR
especially the H → bb decay
using a (PGS) detector simulation.
The discovery of the Higgs particle
introduced a new benchmark
for particle physics projects.
LHeC: consider raising L by 10

Strange Quark Distribution



High luminosity

High Q^2

Small beam spot

Modern Silicon

NO pile-up..

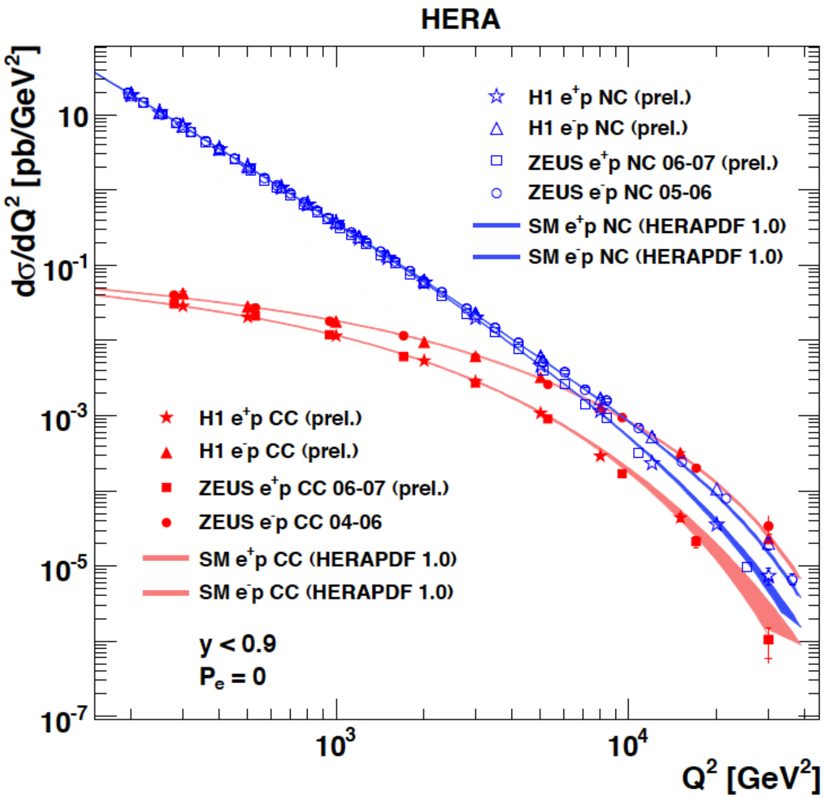
→ First (x,Q^2) measurement of the (anti-)strange density, HQ valence?

$x = 10^{-4} .. 0.05$

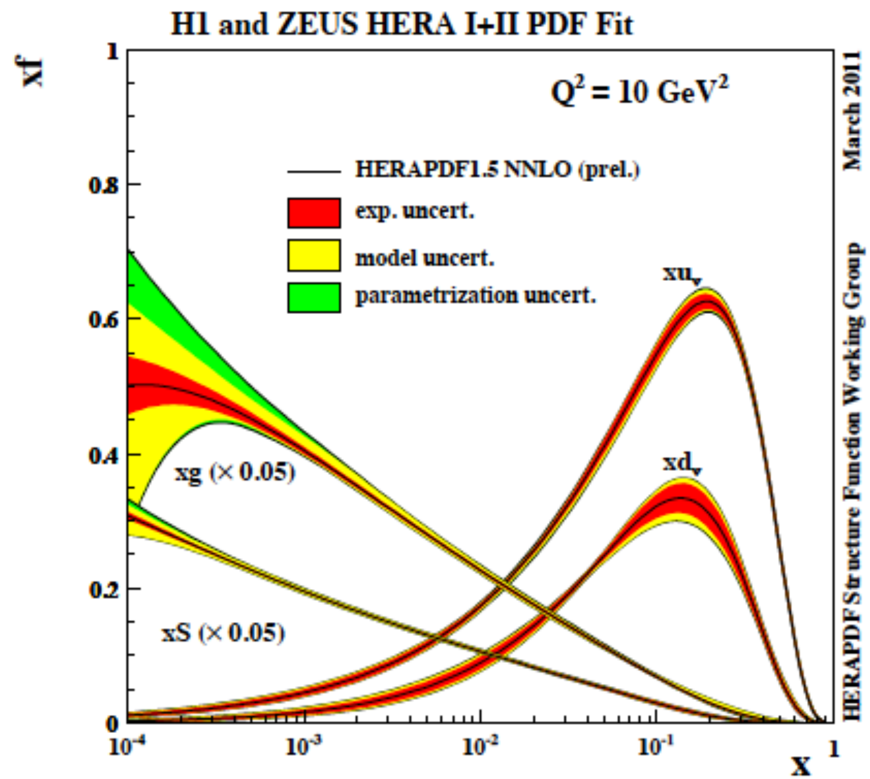
$Q^2 = 100 – 10^5$ GeV^2

Initial study (CDR): Charm tagging efficiency of 10% and 1% light quark background in impact parameter

Unique DIS Physics - Results from HERA



The weak and electromagnetic interactions reach similar strength when $Q^2 \geq M^2_{W,Z}$



F_2 rises towards low x, and xg too.
Parton evolution - QCD to NNLO

Measurements on α_s, Basic tests of QCD: longitudinal structure function, jet production, γ structure
Some 10% of the cross section is diffractive (ep → eXp) : **diffractive partons; c,b quark distributions**
New concepts: unintegrated parton distributions (k_T) , generalised parton distributions (DVCS)
New limits for leptoquarks, excited electrons and neutrinos, quark substructure, RPV SUSY
Interpretation of the Tevatron measurements (high Et jet excess, M_W, searches..), + **base for PDF fits**..
