

# Neutrinos from blazars

five years after the IC 170922A / TXS 0506+056 event

Matteo Cerruti

Université Paris Cité  
Astroparticule et Cosmologie (APC)

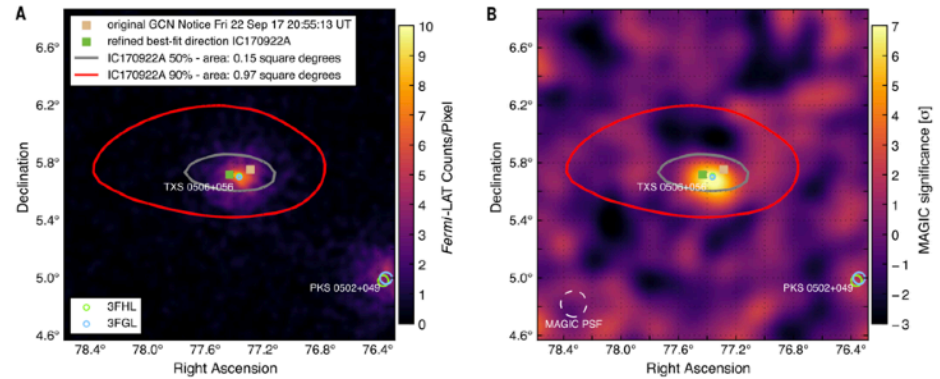

TeVPA 2022

Kingston, ON  
August 9, 2022

# IceCube-170922A / TXS 0506+056

Most significant association ( $3\sigma$ )  
of a high-energy (290 TeV) neutrino with an astrophysical source

[IceCube, Fermi, MAGIC et al. 2018](#)

# BLAZARS

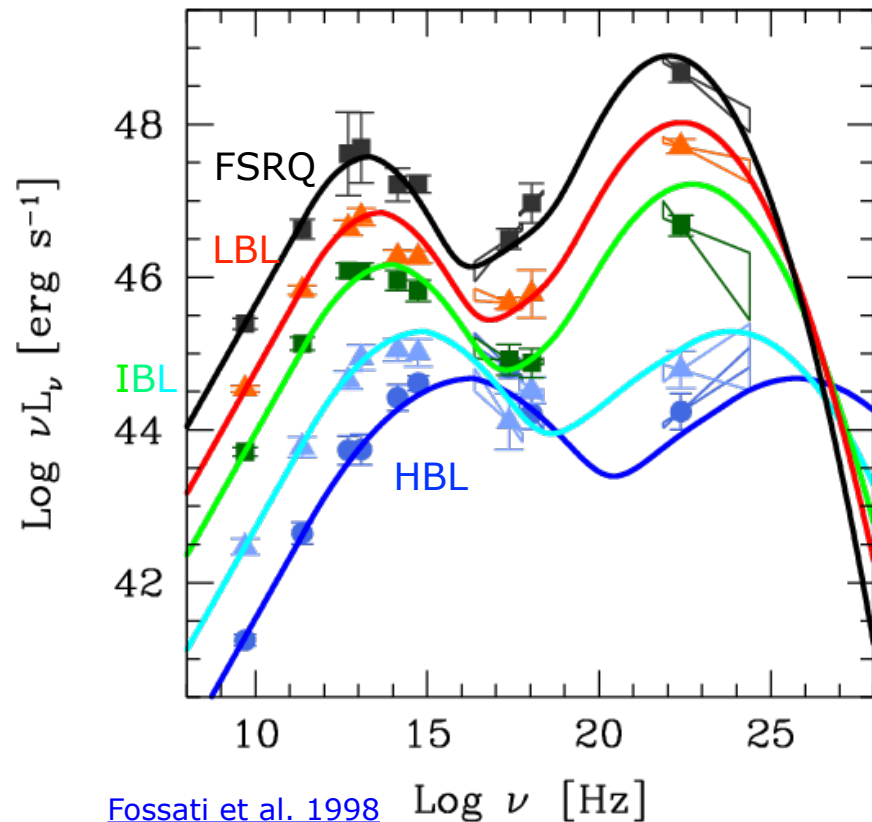

Blazar: **radio-loud** AGN whose relativistic jet points towards the observer

→ Radiative emission from the jet dominates over all other components (non-thermal emission from radio to gamma-rays and fast variability)

**Flat-spectrum-radio-quasars** : optical/UV spectrum with broad emission lines  
**BL Lacertae objects** : featureless optical/UV spectrum

# BLAZAR SPECTRAL ENERGY DISTRIBUTIONS

Spectral energy distributions (SED):  
two distinct radiative components

FSRQs show a peak in the IR

BL Lacs are classified into:

- IR peak: low-frequency peaked (LBLs)
- optical peak: intermediate (IBLs)
- UV/X peak: high (HBLs)

# BLAZARS EMISSION MODELS

The low-energy SED component is synchrotron emission by electrons

High-energy emission?

Leptonic models: inverse Compton

Same leptons that radiate synchrotron  
+ their own synchrotron photons (SSC)  
+ external photon fields (EIC)

State-of-the-art models:

HBLs → SSC

LBLs / FSRQs → EIC

Synchrotron-Self-Compton

External-Inverse-Compton  
EIC

# BLAZARS EMISSION MODELS

## Hadronic models

Simplest hadronic model:

The high-energy component is **proton synchrotron radiation**

([Mannheim 1993](#), [Aharonian 2000](#), [Mucke & Protheroe 2001](#))

[Mucke & Protheroe 2001](#)

# BLAZARS EMISSION MODELS

Proton-photon interactions complicate the modeling

Photo-meson

$$p + \gamma = p' + \pi^0 \rightarrow p' + 2\gamma$$

$$p + \gamma = n + \pi^+$$

$$p + \gamma = p' + \pi^+ + \pi^-$$

$$\pi^\pm \rightarrow \mu^\pm + \nu_\mu \rightarrow e^\pm + \nu_\mu + \bar{\nu}_\mu + \nu_e$$

Bethe-Heitler pair production

$$p + \gamma = p' + e^+ + e^-$$

Injection of secondary leptons in the emitting region,  
triggering synchrotron supported **pair-cascades**

Synchrotron emission by **muons** can be important

# BLAZARS EMISSION MODELS

Leptonic and hadronic models can both work!

Example for Mrk 421 in 2011

[Abdo et al. 2011](#)

# TXS 0506+056: THE 2017 FLARE

[Keivani et al. 2018](#)  
 $\nu \simeq 10^{-5} \text{ yr}^{-1}$

(a) Proton synchrotron modeling of TXS 0506+056

[Cerruti et al. 2019](#)  
 $\nu = 10^{-5} - 10^{-3} \text{ yr}^{-1}$

Proton synchrotron solutions exist,  
 but the expected neutrino rate is very low

[Gao et al. 2018](#)

# TXS 0506+056: THE 2017 FLARE

## Lepto-hadronic solutions

[Cerruti et al. 2019](#)

$$L_{jet} = (9 - 60) \times 10^{47} \text{ erg/s}$$

$$\nu = 0.01 - 0.06 \text{ yr}^{-1}$$

[Gao et al. 2018](#)

$$L_{jet} \simeq \times 10^{50} \text{ erg/s}$$

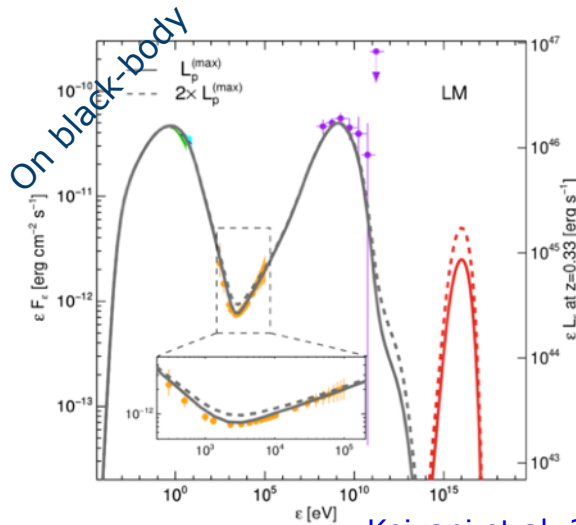

$$\nu = 0.3 \text{ yr}^{-1}$$

They can work: neutrino rates of the order of 0.1 / yr

But rather high energetic requirement :  $L_{jet} \gg L_{Edd} \simeq \times 10^{46-47} \text{ erg/s}$

# TXS 0506+056: THE 2017 FLARE

## Proton-photon interaction on external photon fields

[Keivani et al. 2018](#)

$$L_{jet} = (4 - 150) \times 10^{45} \text{ erg/s}$$

$$\nu_{max} = 0.02 \text{ yr}^{-1}$$

$$L_{jet} = (3 - 8) \times 10^{45} \text{ erg/s}$$

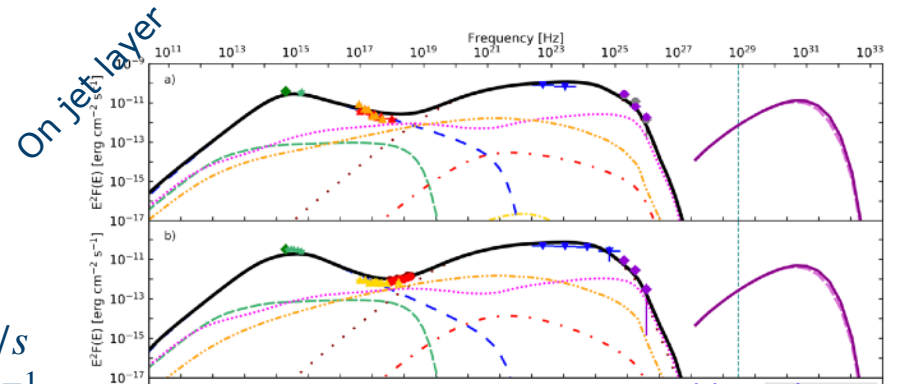

$$\nu = 0.12 - 0.34 \text{ yr}^{-1}$$

[Righi et al. 2019](#)

$$L_{jet} = 6.3 \times 10^{45} \text{ erg/s}$$

$$\nu = 0.14 \text{ yr}^{-1}$$

[Ansoldi et al. 2018](#)

# TXS 0506+056: THE 2014/15 $\nu$ FLARE

Detection of a second neutrino flare in 2014-2015  
(without a gamma-ray counterpart)

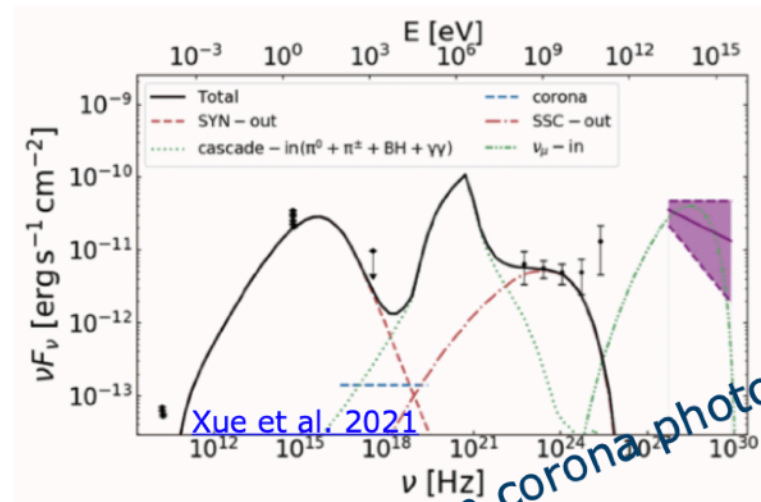

3.5 $\sigma$  evidence for neutrino emission in 2014-2015 independent from the 2017 event

# TXS 0506+056: THE 2014/15 $\nu$ FLARE

1-zone models

External field models

On corona photons

# WHAT HAPPENED SINCE THEN?

## PKS 1502+106 (FSRQ@z=1.83) and IC190730A:

Spatial association but no flaring activity during the neutrino event

[Rodrigues et al. 2021](#)

# WHAT HAPPENED SINCE THEN?

## 3HSPJ095507.9+355101 (Extreme HBL @ $z=0.56$ ) and IC200107A:

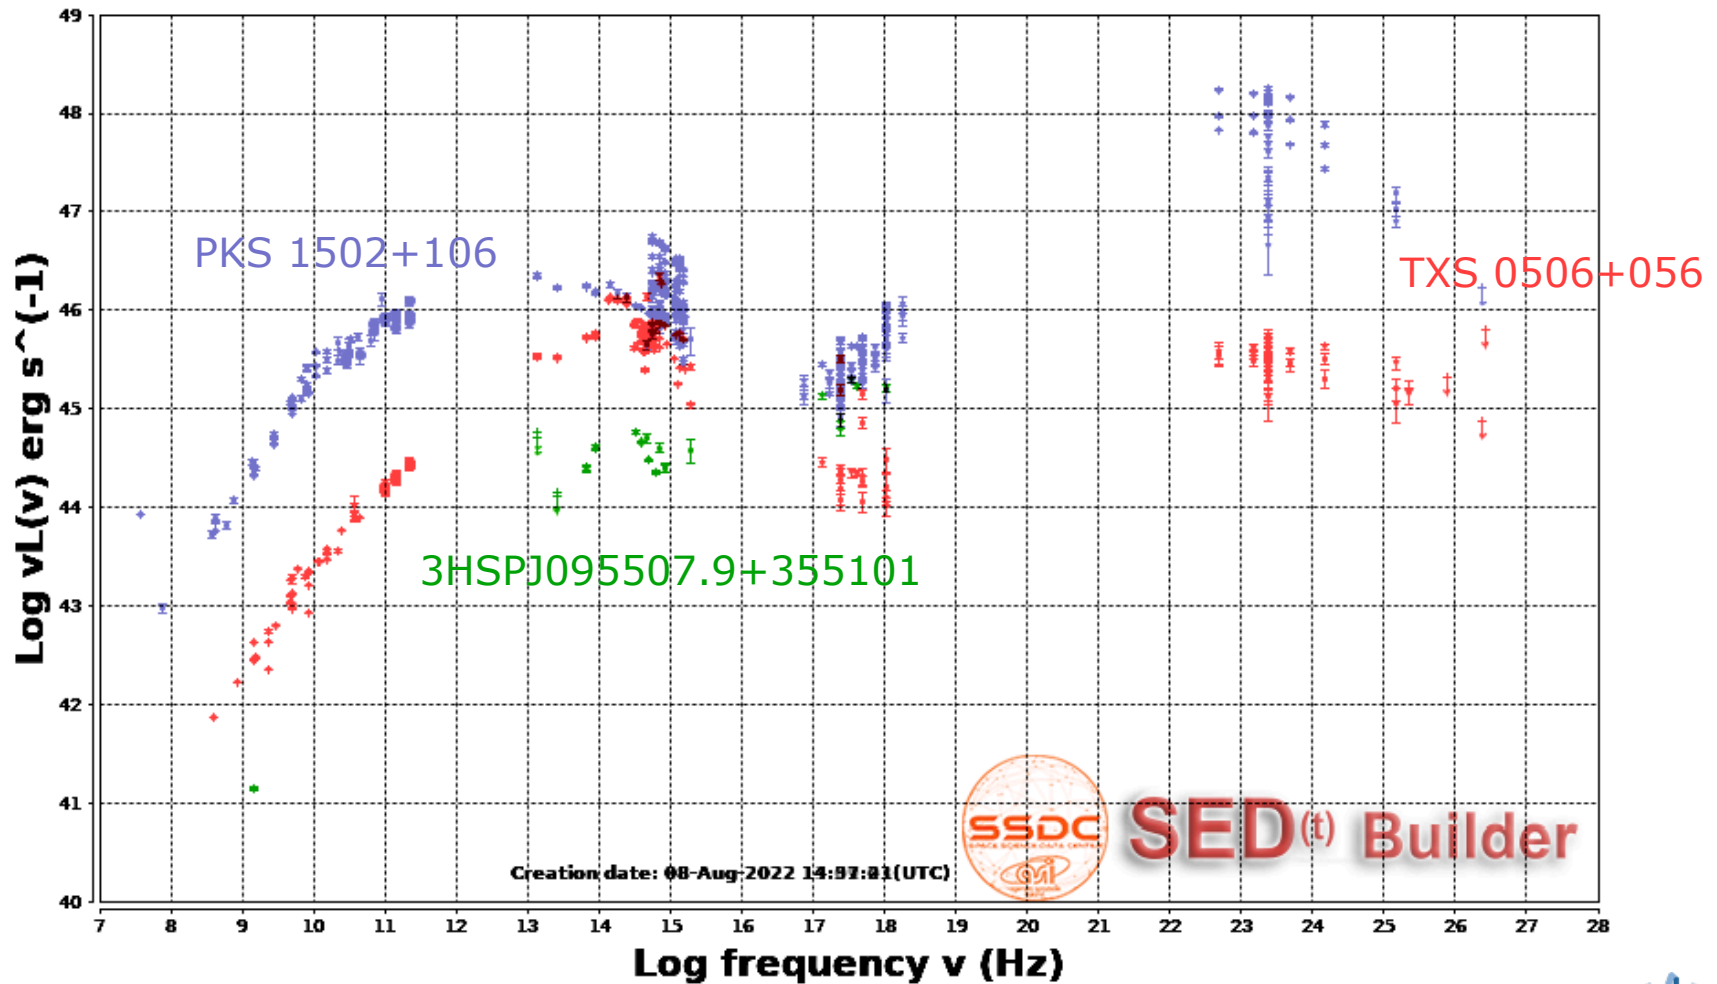

Spatial association (1.7% prob.) but no flaring activity (Fermi hardening?)

[Giommi et al. 2020](#)

# WHAT HAPPENED SINCE THEN?

## Three very different blazars

# PKS 0735+178

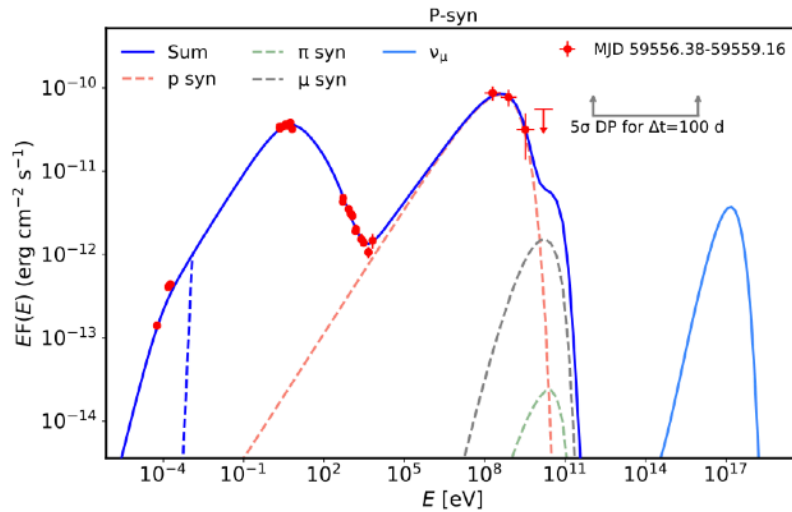

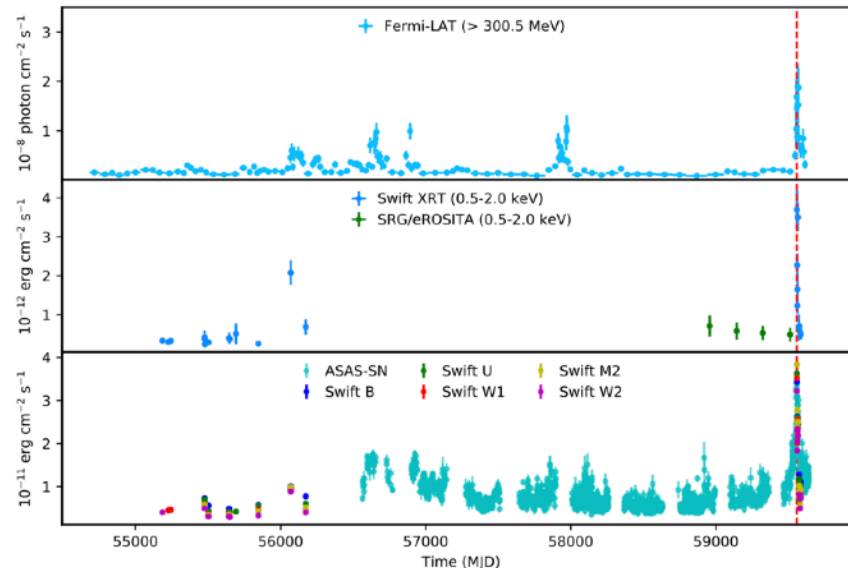

---

IBL@z=0.65? (>0.42) and IC211208A:

- Neutrino in IC with false alarm rate of 1.2 /yr ([GCN](#))
- LAT source 2.2deg away (slightly beyond the 90% contour)
- Neutrino in Baikal (4h later). Chance coincidence prob.  $2.85\sigma$  ([ATel](#))
- Neutrino in KM3Net on Dec.15, p-value of 14% ([ATel](#))
- Neutrino in Baksan on Dec.4, p-value of 0.2% ([ATel](#))
- Flaring in Fermi-LAT, optical, X-rays

# PKS 0735+178

First theory paper by [Sahakyan et al. 2022](#)

# PKS 0735+178

First theory paper by [Sahakyan et al. 2022](#)

# HIGH-LUMINOSITY / HIGH-PEAK BLAZARS

Are we looking at outliers in the blazar population?

# BLAZAR FLARES

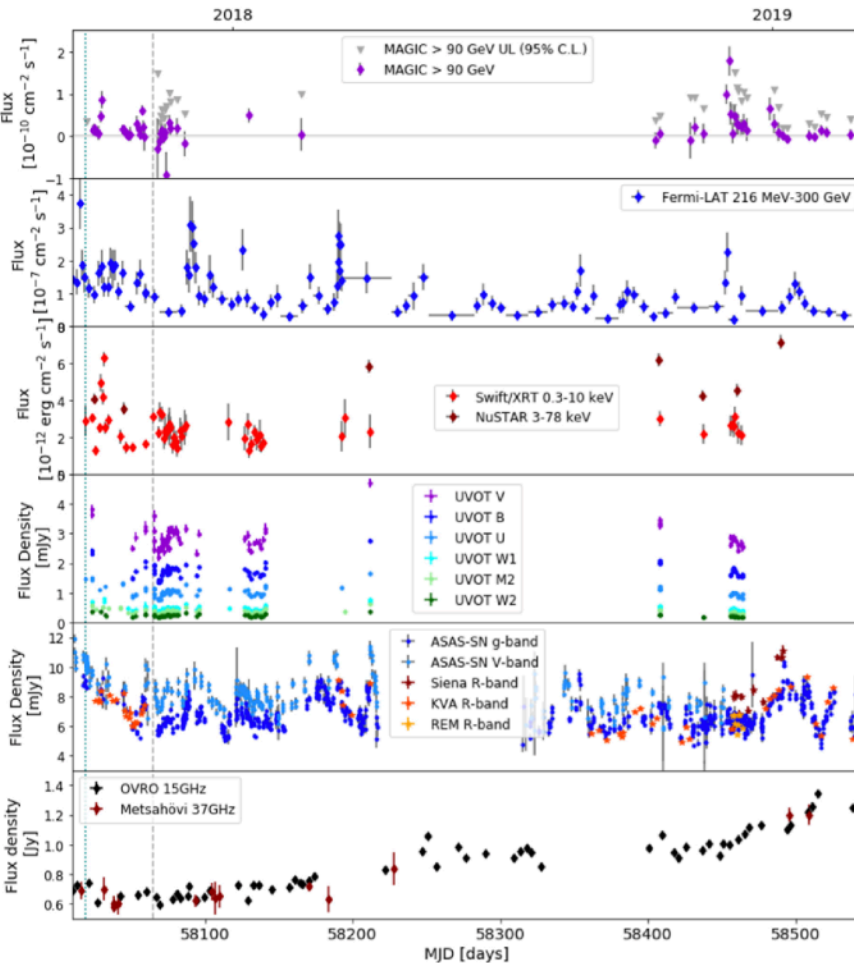

## Search for neutrino blazar flares in IC data

[Abbasi et al. 2021](#)

# TXS 0506+056 AGAIN

2017-2019 MWL monitoring of TXS 0506+056 after the neutrino event ([Acciari et al. 2022](#))

New VHE flare in December 2018

No neutrinos associated with it

Low-state SED much better characterized

# ALL-SKY SEARCHES

IceCube 10-year paper ([Aartsen et al. 2020](#))

Hottest spot at 2.9 sigma (post-trial) on NGC 1068  
TXS 0506+056 stands out at 3.1 sigma pre-trial

# ALL-SKY SEARCHES

ANTARES 10-year paper ([Albert et al. 2021](#))

Hottest spot at 2.3 sigma on the blazar 3FGLJ2255.1+2411  
2.6 sigma when considering information from the IceCube event IC100608A

# ALL-SKY SEARCHES

Contribution of Fermi-LAT blazars to the IceCube diffuse neutrino spectrum

[Aartsen et al. 2017](#)

Cannot contribute to more than ~20%

# ALL-SKY SEARCHES

Correlation between IceCube neutrinos and the brightest radio-loud AGNs

Chance probability estimated at 0.2%  
But not confirmed by other authors ([Zhou et al. 2021](#))  
Nor by IceCube, see yesterday's talk by C. Lagunas-Gualda

# ALL-SKY SEARCHES

Correlation between IceCube neutrinos and extreme blazars

[Padovani et al. 2016](#)

Chance probability estimated at ~1%

Correlation with BZCat blazars (Southern sky only)

[Buson et al. 2022](#) (three weeks ago)

Chance probability minimum at  $6e-7$ !

# CONCLUSIONS

---

- The TXS 0506+056 event of 2017 is still our best evidence for joint photon and neutrino emission from a blazar
- Several new multi-messenger campaigns, but nothing clear: we are **still in the hotspot era**
- Several claims for significant association from all-sky searches
- Are we learning something on AGNs? Do we have hadronic/ neutrino blazars and leptonic blazars? Are we too much biased by our knowledge of the photon universe?

# CONCLUSIONS

---

Where do we go from here?

- **Hard-X-rays / VHE gamma-rays** proved to be extremely important to constrain the models
- Huge need for an **MeV** satellite
- Wait for another neutrino blazar (or not!)
