Keywords: STM, SST, SSA, industry

The interest in the SST and STM domain is rapidly growing at a pace similar to the increase of the number of satellites recently launched to space.

This is also happening in Europe following the relevant initiatives in the institutional domain (from ESA, several national agencies and the European Union through the EU-SST) and in the commercial market.

This is creating a good opportunity for the development of relevant capabilities that are increasing the competitiveness of the European industry working in the domain.

One good example of this industrial growth and success is GMV (<https://www.gmv.com/>), which has a long-standing reputation as the most competent and reliable European supplier and integrator of ground segment infrastructure and related services and operations including remarkable experience in Space Surveillance and Tracking (SST) domain where 90+ engineers work in 7 countries (ES, FR, DE, UK, PT, PL & RO), being the largest SST-dedicated team in Europe.

The experience and industrial growth of GMV in the domain in the last decade in the SST and STM domain will be presented.
