

# A study of the lobes of radio galaxy Hydra A using MeerKAT observations

*Wednesday 15 September 2021 13:30 (15 minutes)*

Hydra A is a type I Fanaroff-Riley radio galaxy that hosts a pair of 300-kiloparsec diameter radio lobes that are being powered by one of the most of the powerful AGN outbursts known to date. Radio observations provide us with an excellent probe for the study of high-energy particles residing in the lobes. The MeerKAT radio telescope carried out observations of Hydra A, from which we obtained radio maps at several frequencies. A spatial analysis of the radio maps reveals a pair of inner lobes and a pair of outer lobes. We computed the radiative flux densities using these observations and combined them with previous results from low-frequency VLA observations at 74 MHz and 327 MHz. We found that the spectrum in the MeerKAT frequency range is well described by a power law. We set constraints on the magnetic field strength and the age of the outer radio lobes through electron spectrum modelling which includes electron aging.

## Abstract field

**Author:** NAIDOO, Mika (University of the Witwatersrand)

**Co-authors:** CHEN, Andrew (University of the Witwatersrand); PROKHOROV, Dmitry (Linnaeus University); MARCHEGLIANI, Paolo (Sapienza Università di Roma); SERRA, Paolo (INAF); MAKHATHINI, Sphesihle (University of the Witwatersrand)

**Presenter:** NAIDOO, Mika (University of the Witwatersrand)

**Session Classification:** AGN III

**Track Classification:** Active Galactic Nuclei
