<sup>1</sup> Thoracic Oncology Group, Medical Oncology Department, Hospital Clinic; <sup>2</sup> MECA - Laboratory of Translational Genomics and Targeted Therapies in Solid Tumors, IDIBAPS, <sup>3</sup> Department of Medicine, University of Barcelona, <sup>4</sup> Radonova Laboratories AB, Uppsala, Sweden

# BACKGROUND

- Radon gas is a **Group 1 carcinogen**, leading cause of lung cancer in non-smokers; 2<sup>nd</sup> one in smokers
- **3-14% of lung cancer cases** depending on:
  - Smoking prevalence
  - Area

Excess lung cancer mortality

Exposure-risk relationship between radon & lung cancer

- Role of radon gas in **other solid tumors remains uncertain**
- **Epidemiological data:**
  - Uranium Miners, recent evidence
  - Indoor radon, no consistent data
- **Ionizing radiation** – Group 1 carcinogen for other solid tumors

## Epidemiological data

No consistent data for other solid tumors

Miners, PUMA cohort

# BACKGROUND: Clinical observations

## MAIN Hypothesis:

1. Radon is associated with molecular profile of lung cancer
2. Identify a radon-associated signature in cancer
3. Improve Biomarkers & Precision Medicine of radon-related cancer

## Preclinical models

Radon inhaled

- Molecular profile of radon-induced lung cancer
- Also → other solid tumors induced by radon

## Clinical studies

### Uranium-workers

### Patients – indoor Rn

BIORADON (EU) – 975 pts  
MIRROR (ES) – 670 pts

- Molecular profile of radon-induced lung cancer
- Differences – sex (female) & age
- Also → similarities with other solid tumors

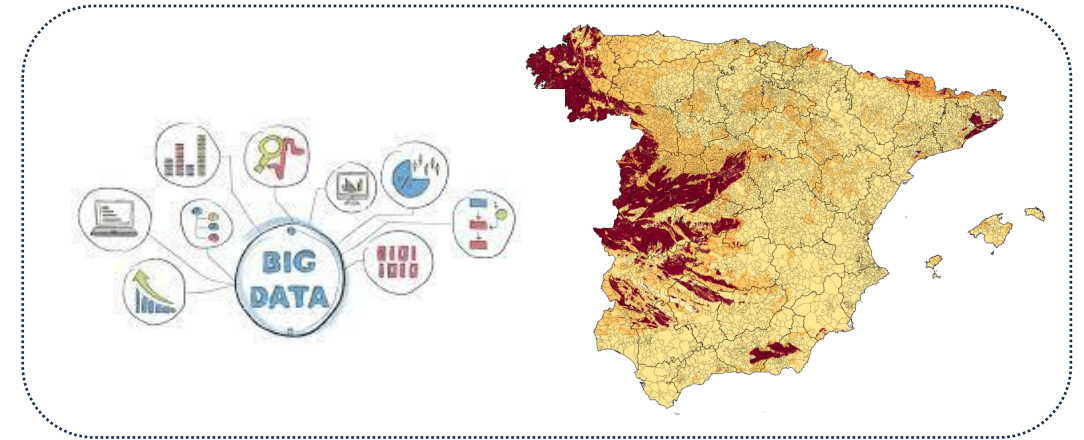

# BACKGROUND: Ecological studies

## ■ ECOLOGICAL study:

- To generate hypothesis - ↓ level of evidence
  - ↑ Big data – to study correlations
  - Limitations: mobility, confounding factors (smoking), pop level reflects patient level?
- 
- BIG question – “integrating our clinical perspective”

**AIM:** To explore the link between cancer mortality and estimated Radon risk areas in Spain to identify priority areas for cancer prevention (focus on radon)

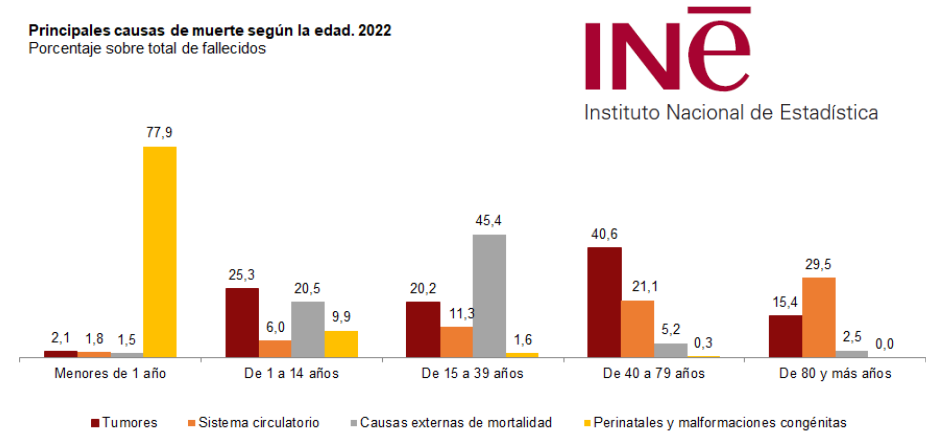

# METHODS

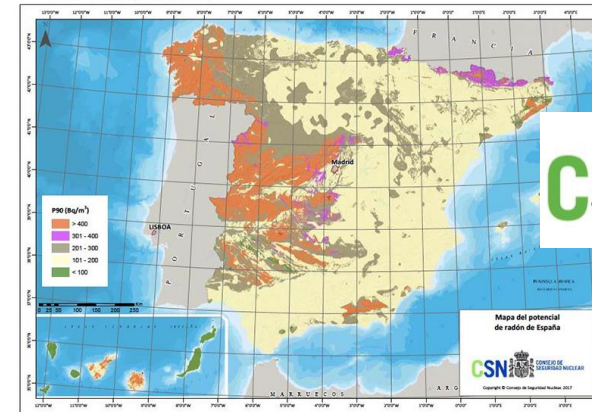

- **Retrospective analysis of mortality cases** recorded in the National Mortality Registry (INE) between 1999-2021 (22 years – period)
- We analyzed **age-standardized rates**, considering **age & sex**, using the ICD-10 classification, in municipalities with >10,000 inhabitants (overall, and the P25 of municipalities with higher rates)
- **Radon classification:** Municipalities grouped into **3 levels (CSN)**:
  - Low: Aggregated very-low and low
  - Medium: Moderate
  - High: Aggregated high and very-high
- **Correlation Analysis:**
  - Used the area of each radon risk category within municipalities
  - Calculated Pearson correlation for each municipality & province
  - Selected results with p-value < 0.05 for significance

Principales causas de muerte según la edad. 2022  
Porcentaje sobre total de fallecidos

INE  
Instituto Nacional de Estadística

Mapa de potencial de radón de España, definido como la concentración de radón que superan (en planta baja o primera) el 10% de los edificios más expuestos de la zona

CSN  
CONSEJO DE SEGURIDAD NUCLEAR

# METHODS: Radon Map

**CSN Map**

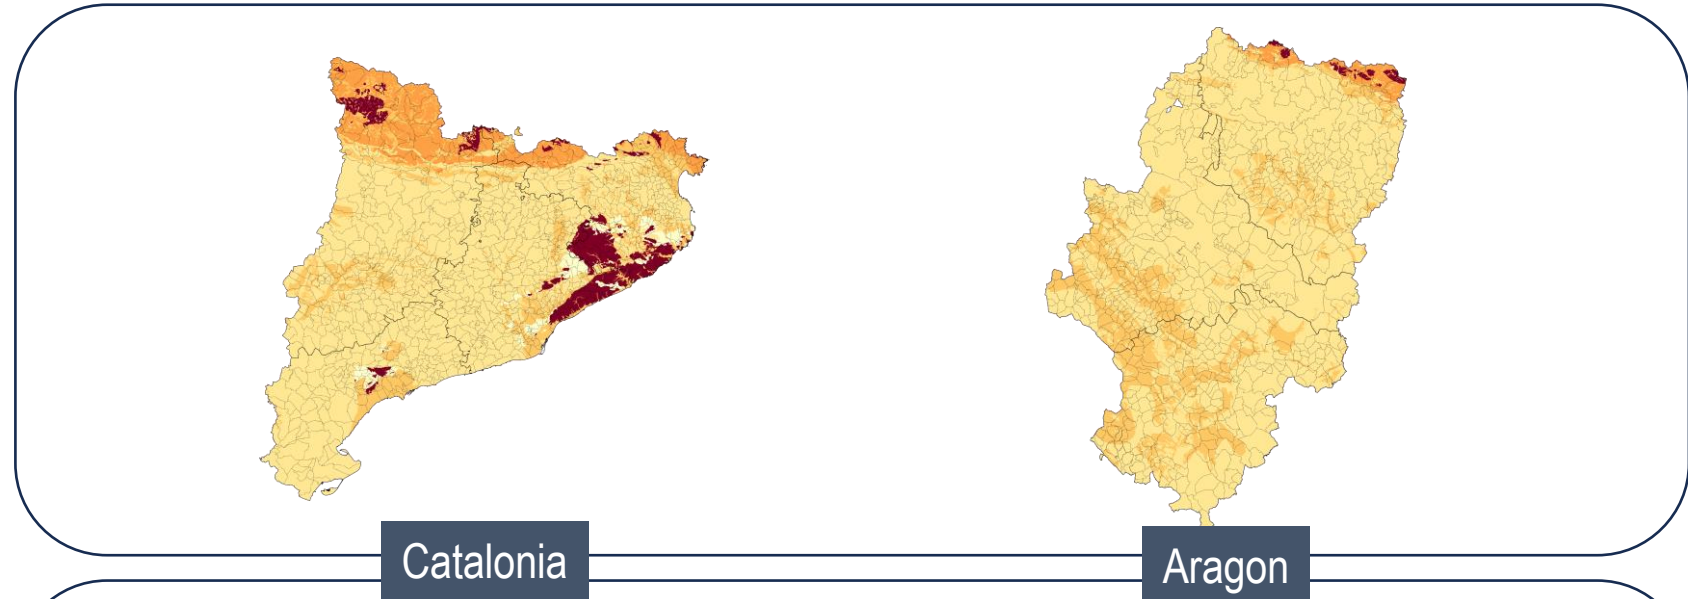

**Radon Map by municipality**

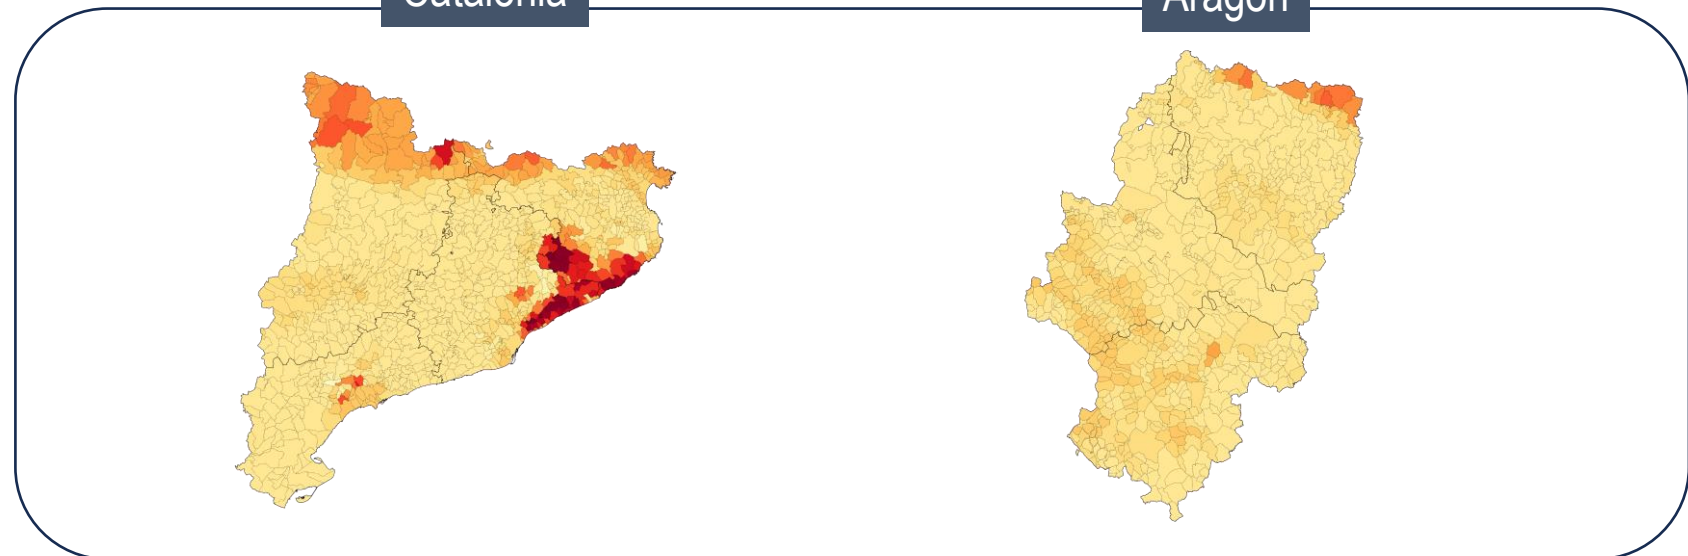

- **Data Source:** CSN
- **Geographic Scope:** All Spain except Canary Islands
- **Geographic Level:** Municipality
- **Radon Levels:** Averaged using areas of 5 categories
- **Category Mean:** Based on CSN-provided means

# Radon Map by regions

CSN Map

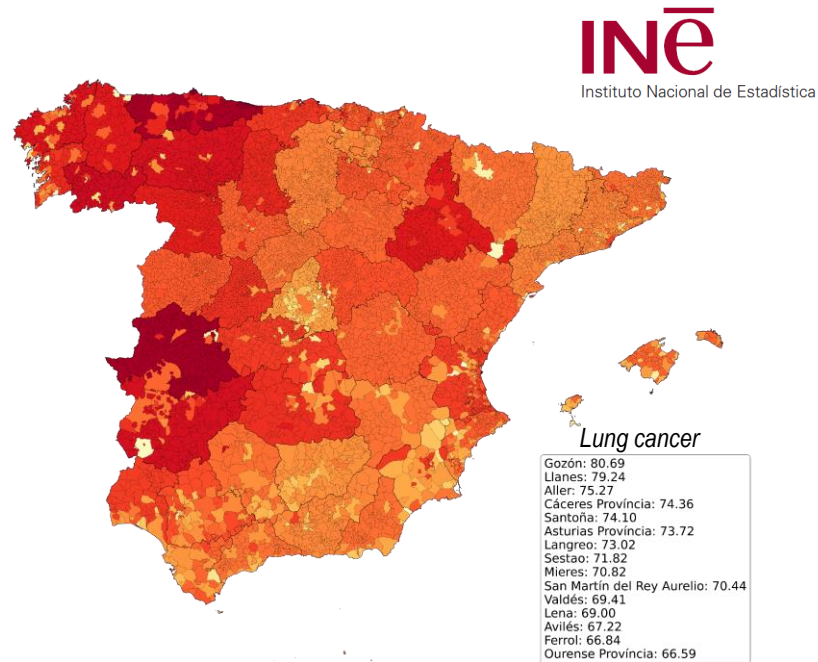

Radon Map by municipality

# METHODS: Data sources

- **Data Source:** INE (1999-2021)
- **Geographic Scope:** Provinces and municipalities (>10,000)
- **Mortality Definition:** Based on ICD-10 cancer classifications
- **Age-Standardized Mortality:** Adjusted to account for age differences

- **Data Source:** CSN
- **Geographic Scope:** All Spain except Canary Islands
- **Geographic Level:** Municipality
- **Radon Levels:** Averaged using areas of 5 categories
- **Category Mean:** Based on CSN-provided means

# RESULTS: Cancer data

	OVERALL Deaths N=9,140,258	CANCER Deaths N=2,351,989
<b>Age (Range)</b>		
> 50 years	8,607,199 (94.2%)	2,200,465 (93.6%)
≤ 50 years	533,059 (5.8%)	151,524 (6.4%)
<b>Sex</b>		
Male	4,710,369 (51.5%)	1,451,814 (61.7%)
Female	4,429,889 (48.5%)	900,175 (38.3%)
<b>Tumor type</b>		
Lung Cancer	468,525 (19.9%)	
Colon Cancer	244,457 (10.4%)	
Breast Cancer	143,126 (6.1%)	

- **Municipalities:**
  - 87 (10.7%) were in high-radon areas
  - 153 (19.7%) in intermediate
  - 527 (69.5%) in low-radon areas

# RESULTS: 20 years Mortality evolution

## Evolution - dynamics

**Example:** Catalonia, Lung Cancer

20 years period – lung cancer mortality evolution

# RESULTS: Cancer data (Map)

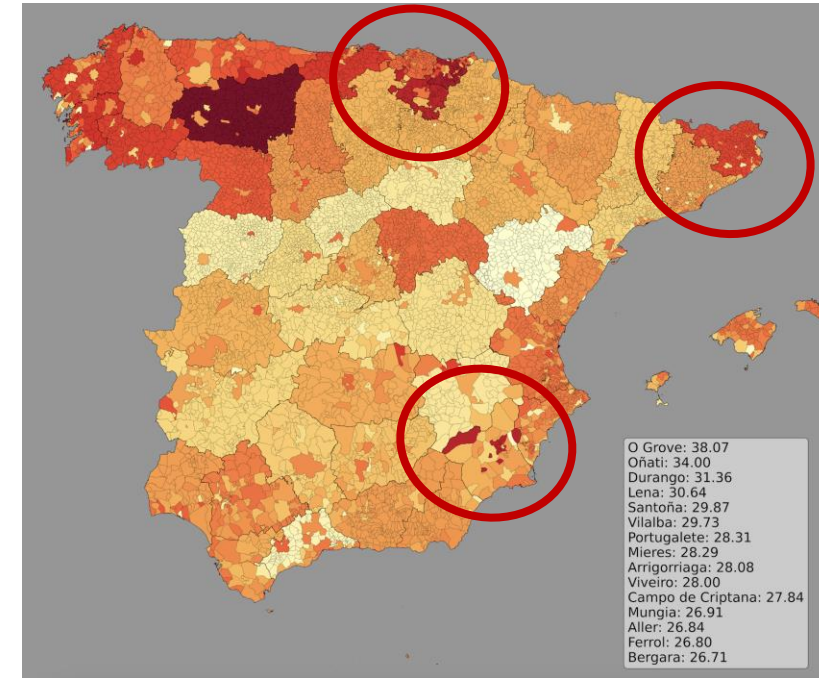

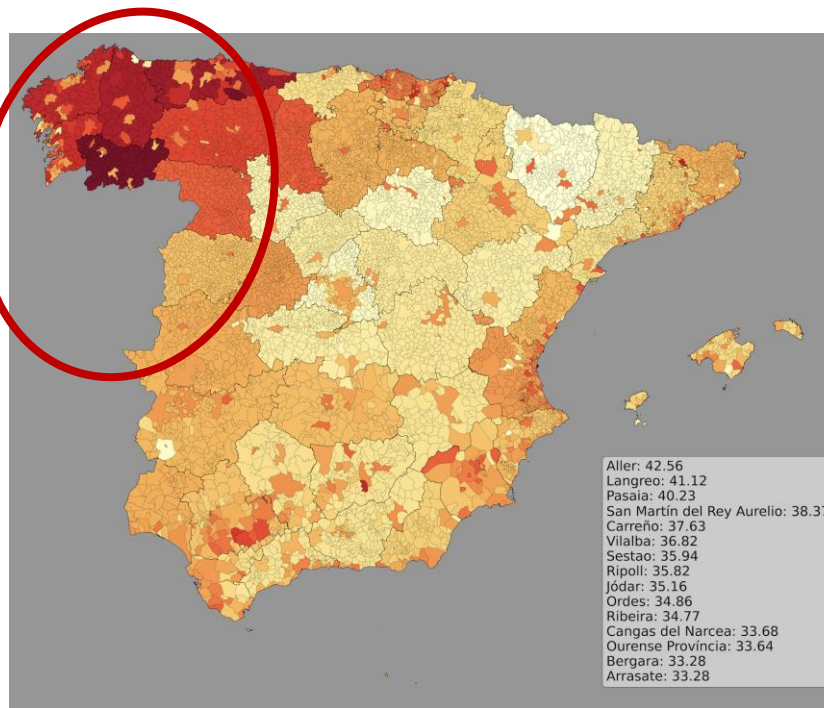

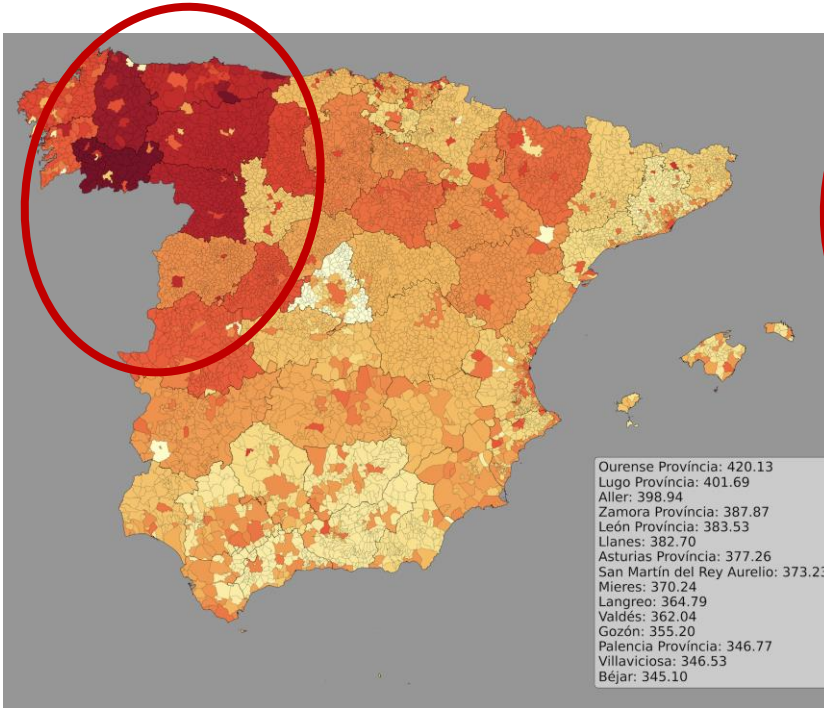

Overall

Male (<50 yrs)

Female (<50 yrs)

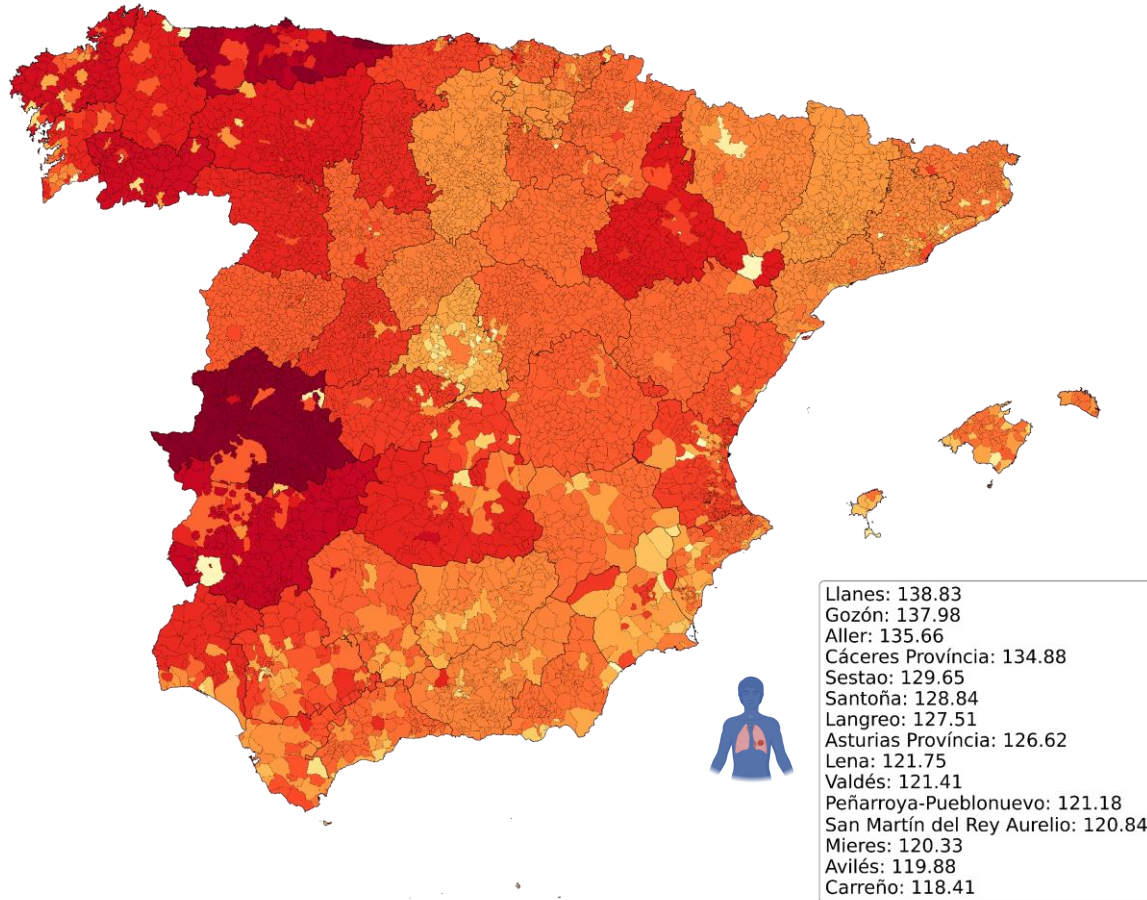

To STUDY – Age and Sex differences

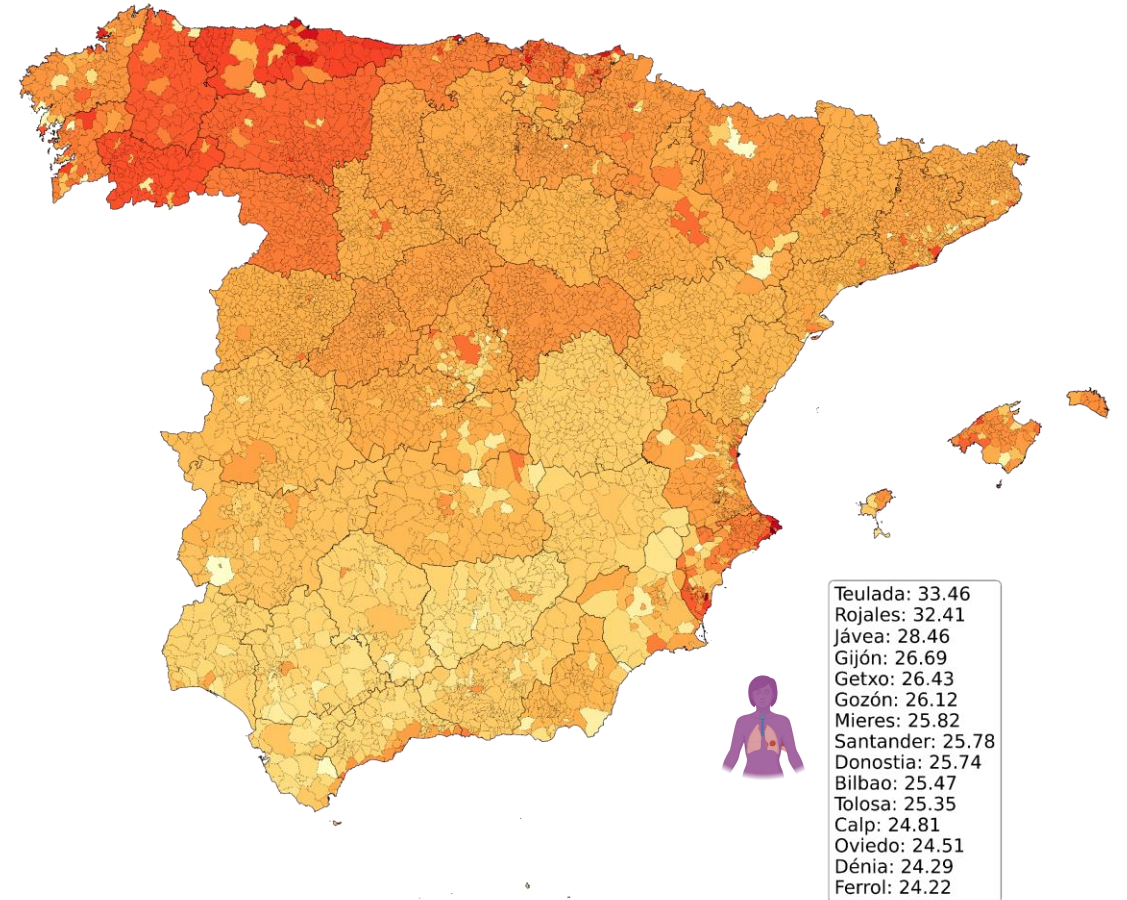

# RESULTS: Lung cancer Mortality

## Sex differences

### Male

### Female

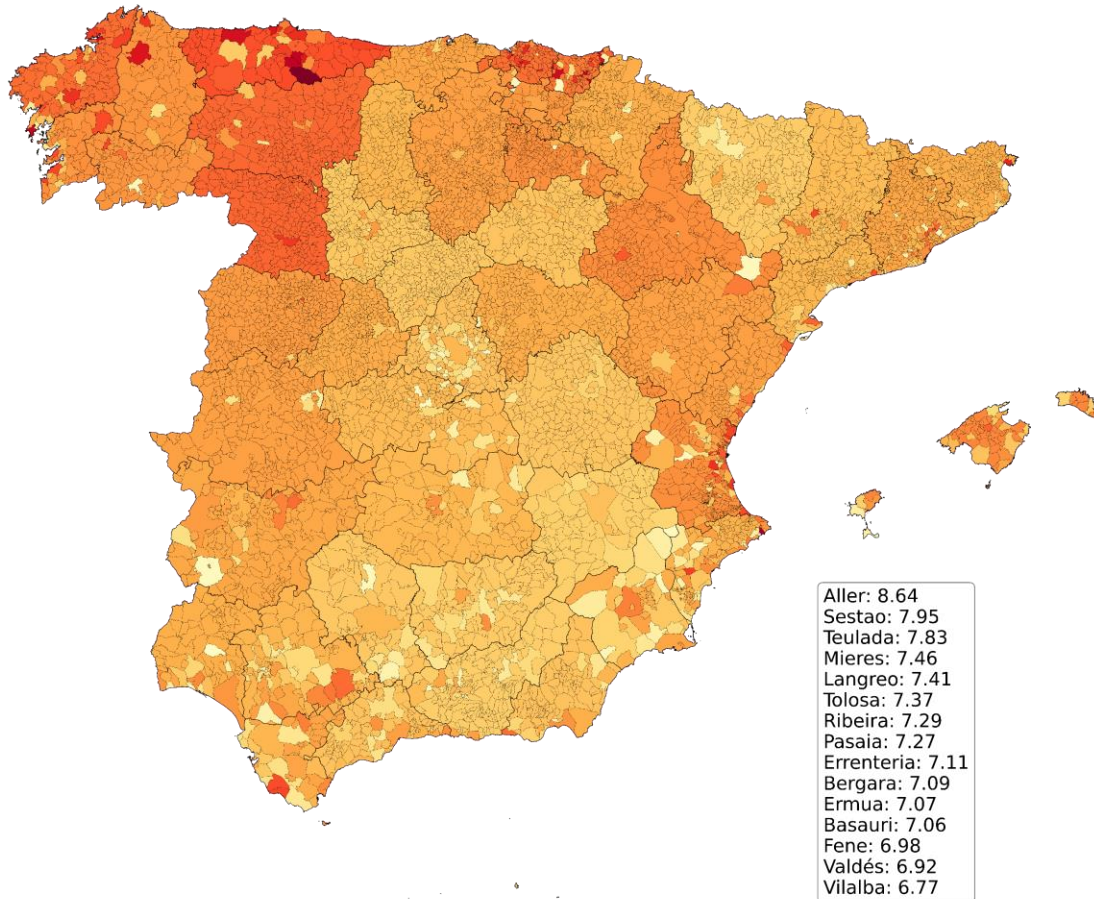

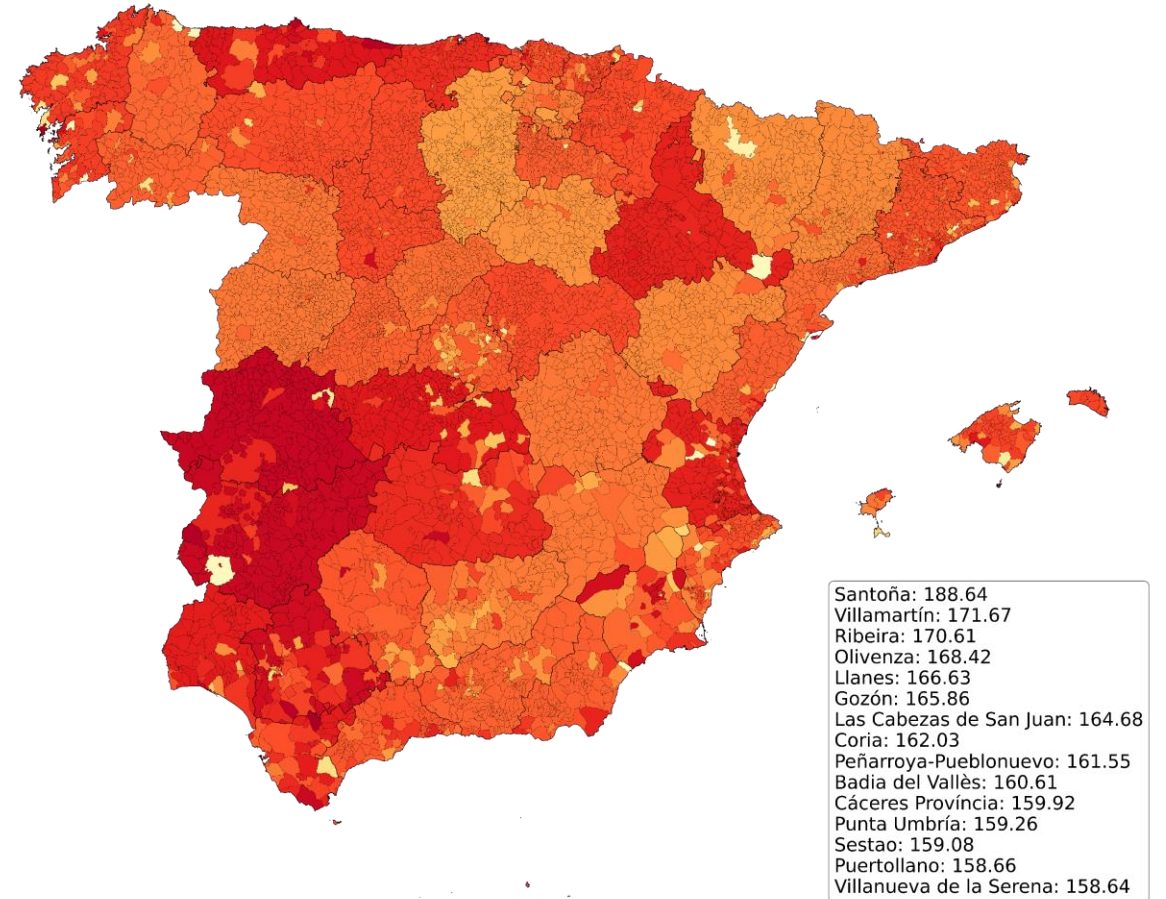

# RESULTS: Lung cancer Mortality

## Age differences

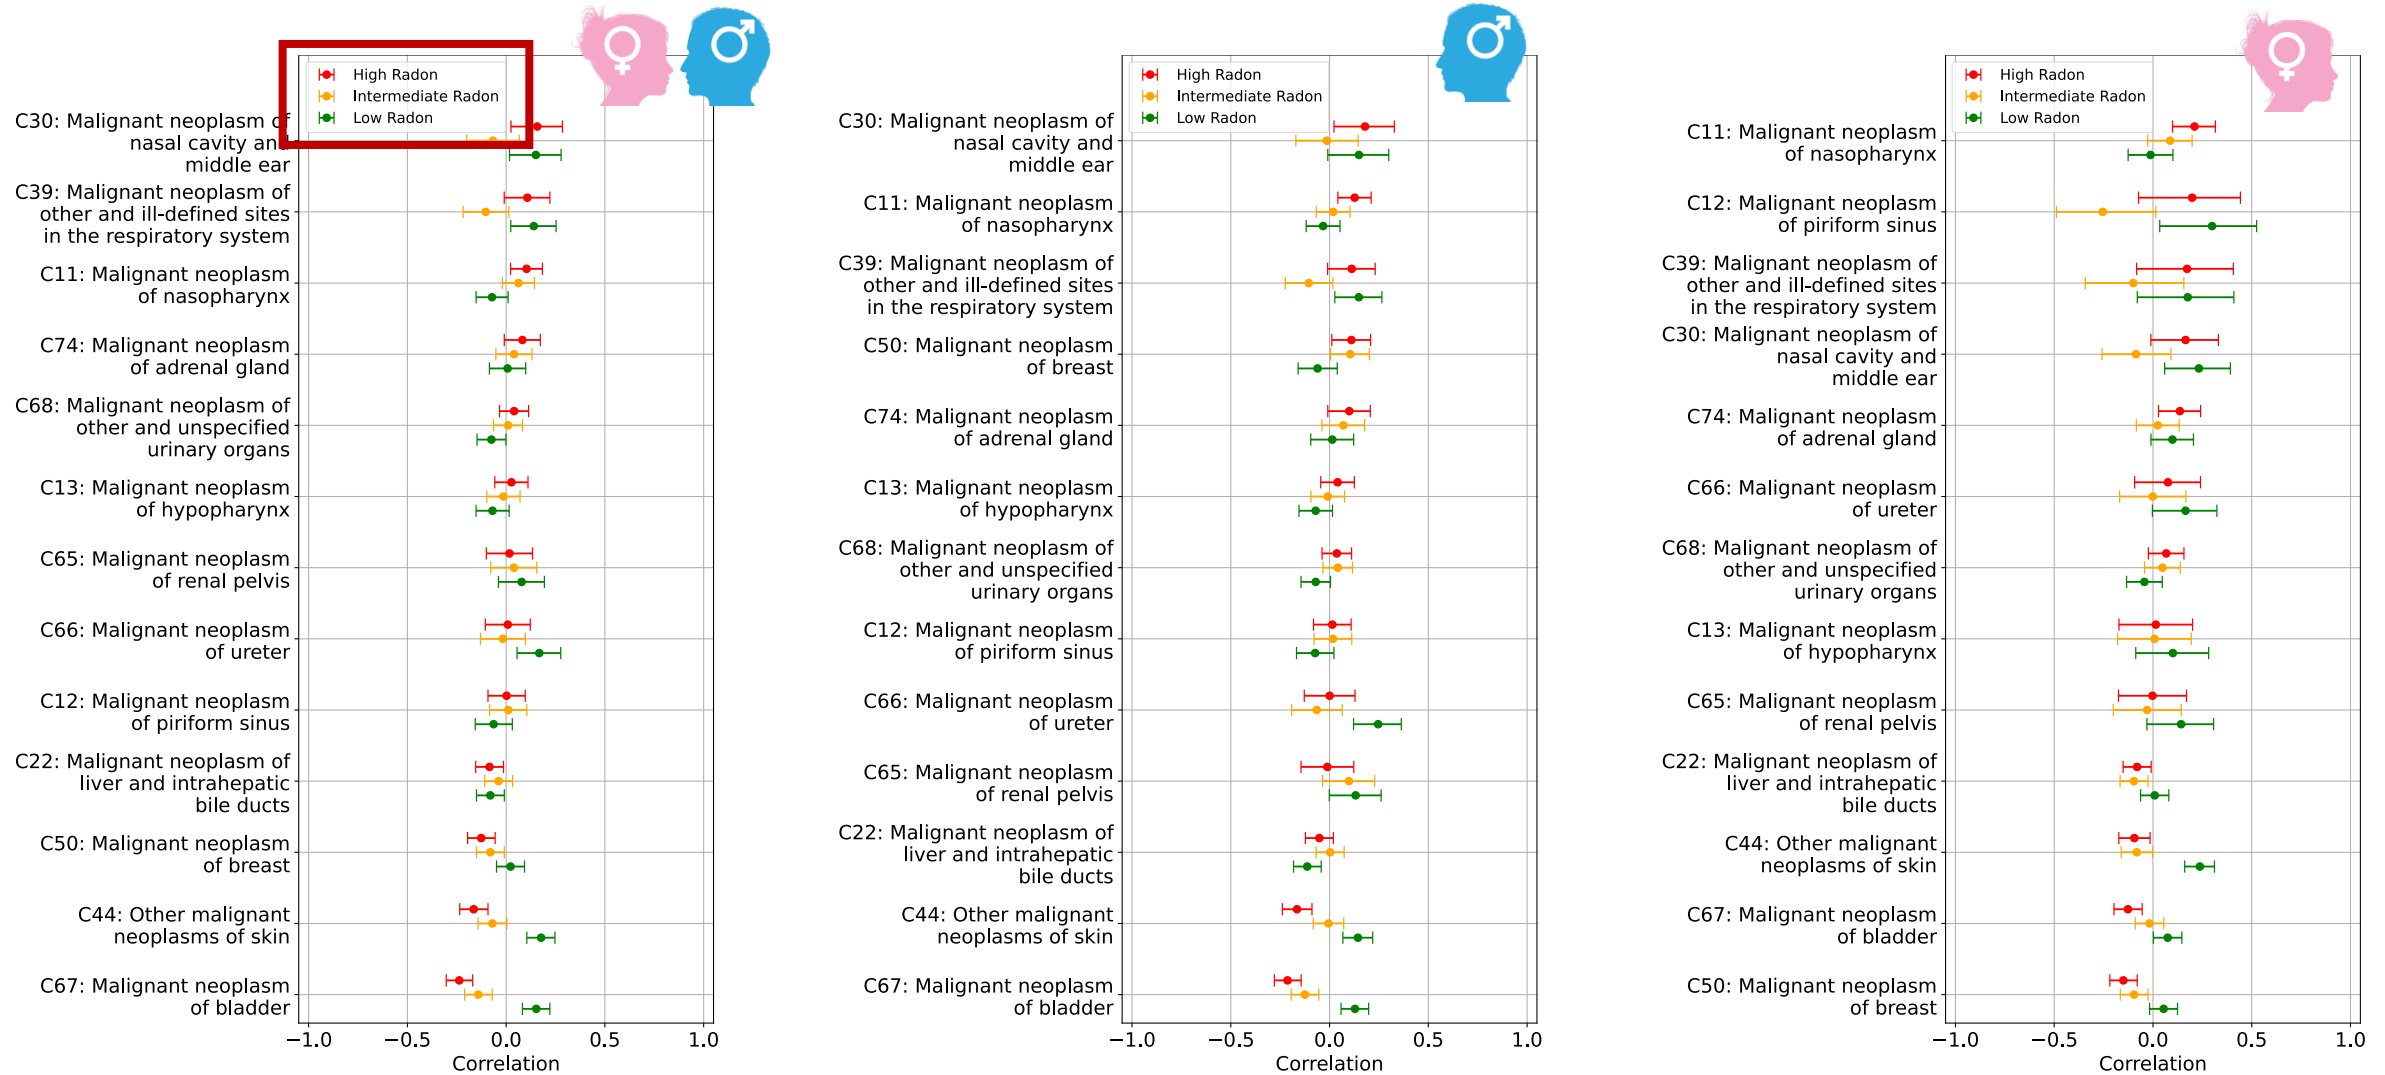

Age  $\leq$  50

Age  $>$  50

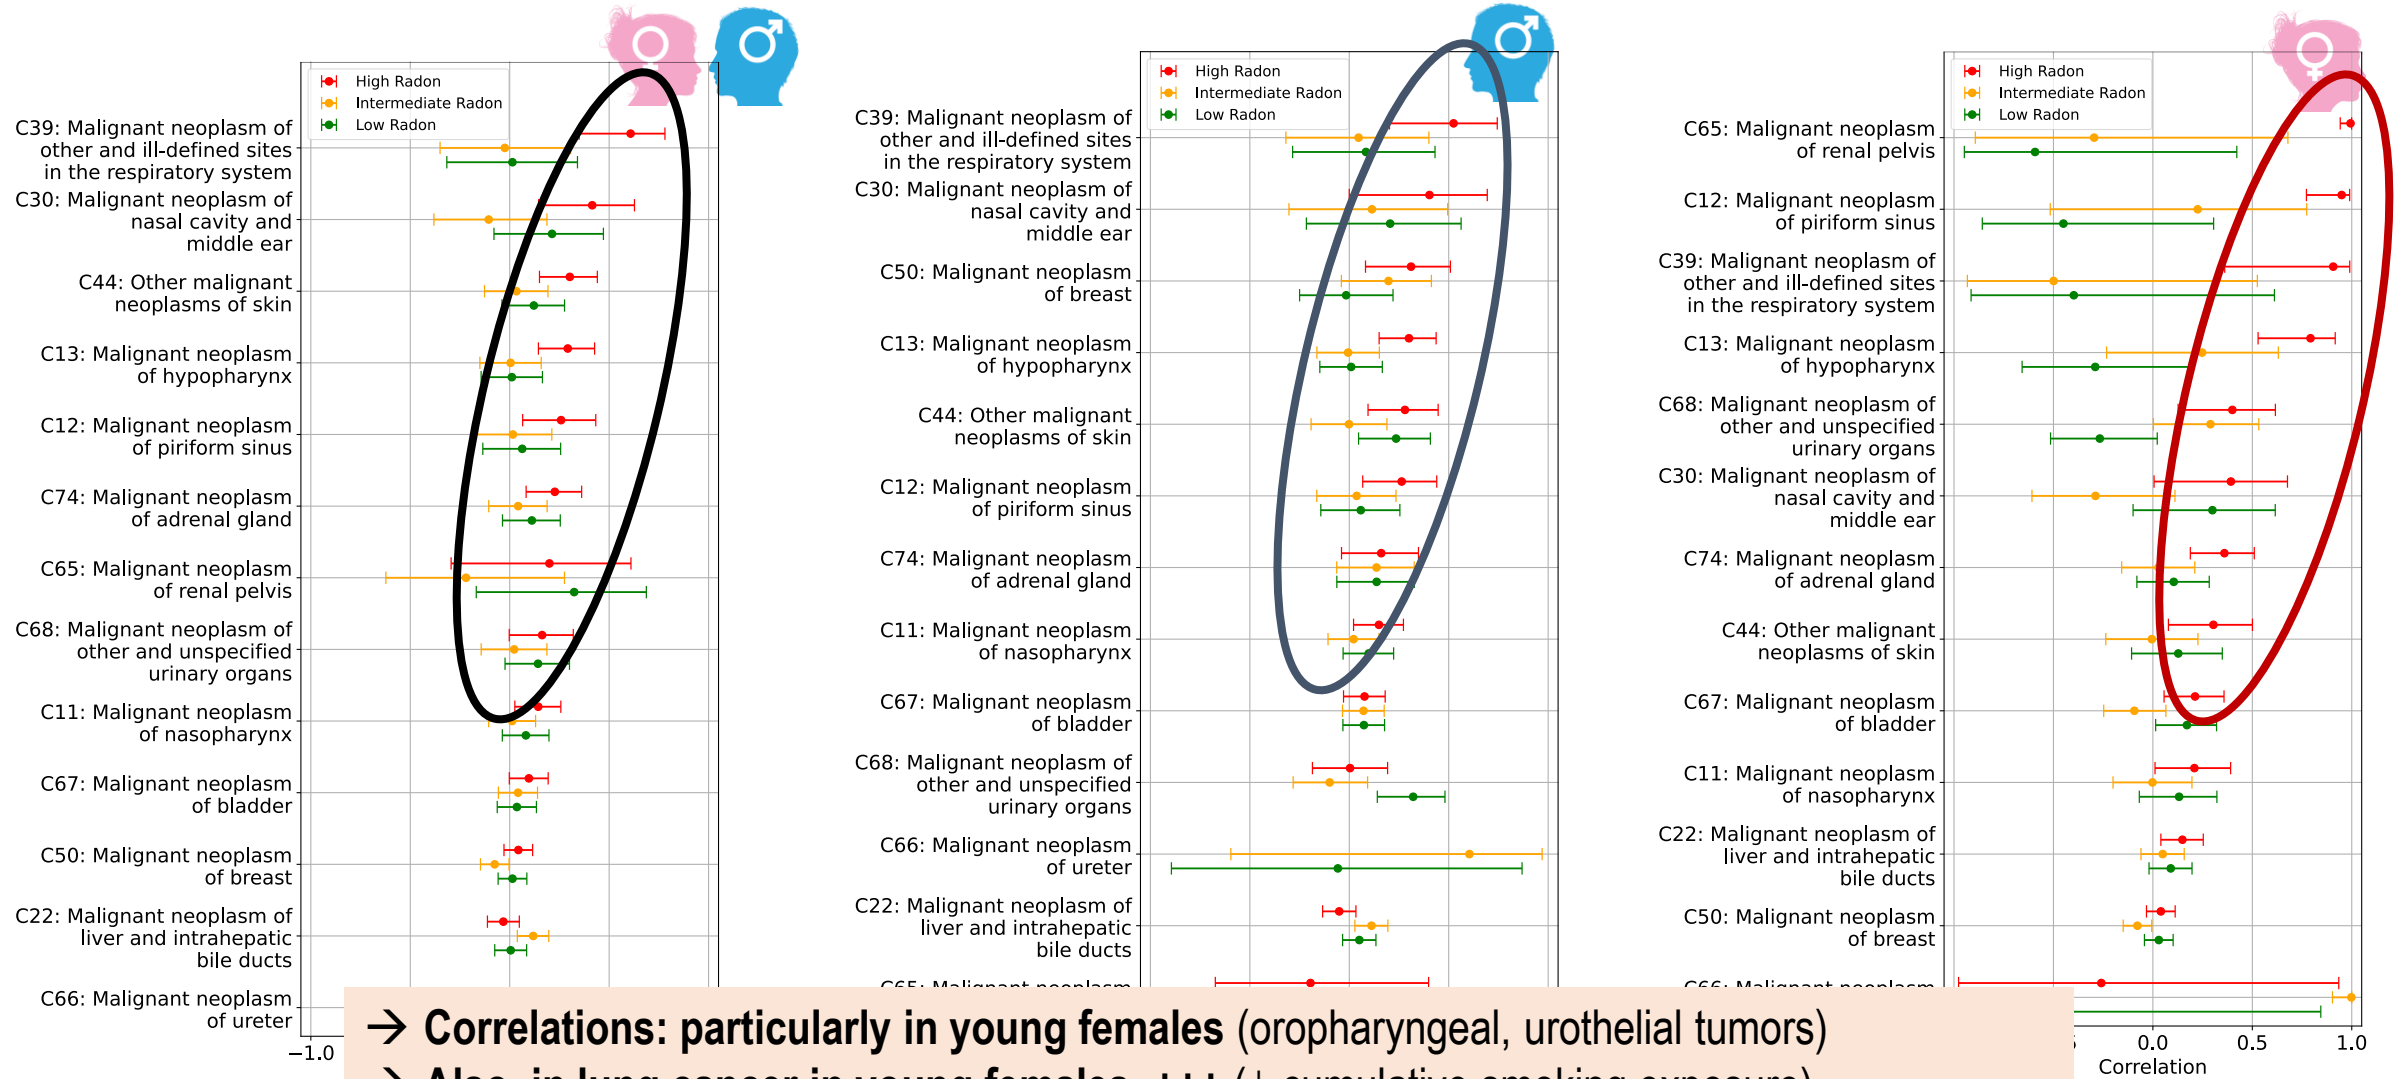

# RESULTS: Correlation [all ages]

**No correlation between cancer mortality & estimated radon risk areas**

# RESULTS: Correlation [young pop]

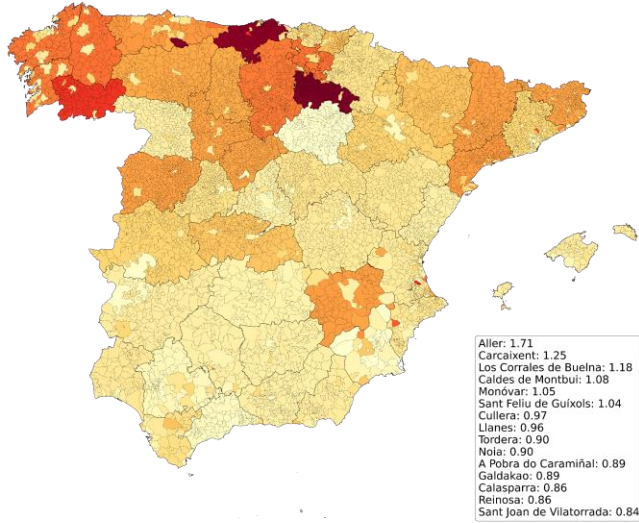

→ Correlations: particularly in young females (oropharyngeal, urothelial tumors)  
 → Also, in lung cancer in young females, +++ (↓ cumulative smoking exposure)

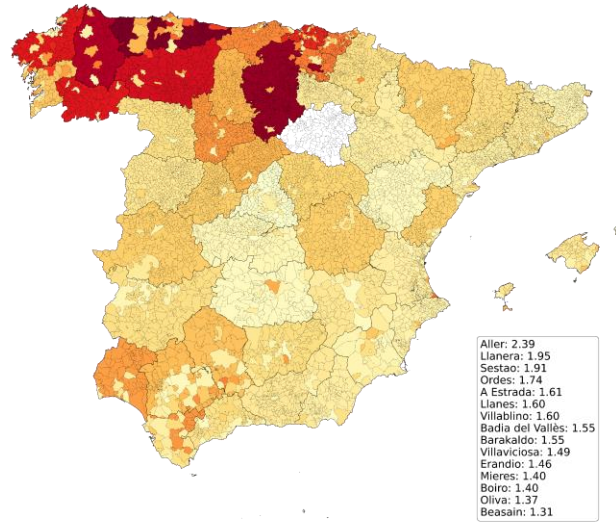

# Results: Other Cancers Age-Standardized Mortality

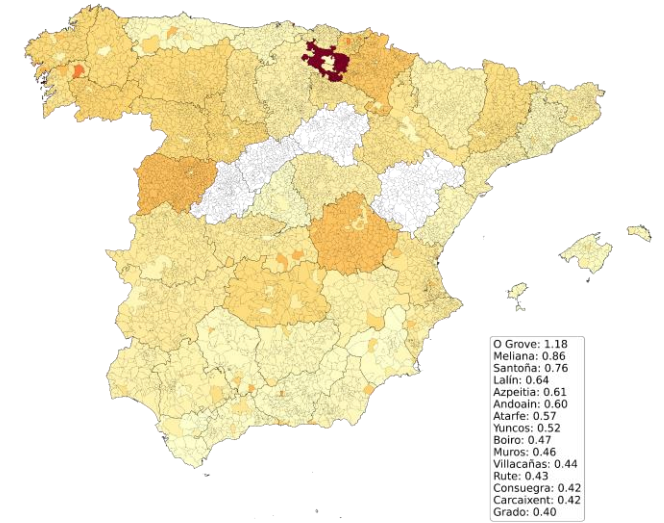

## Pyriiform Sinus

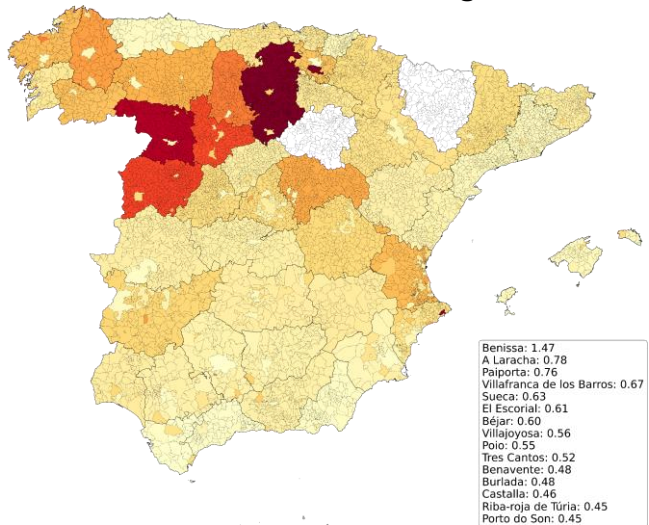

## Hypopharynx

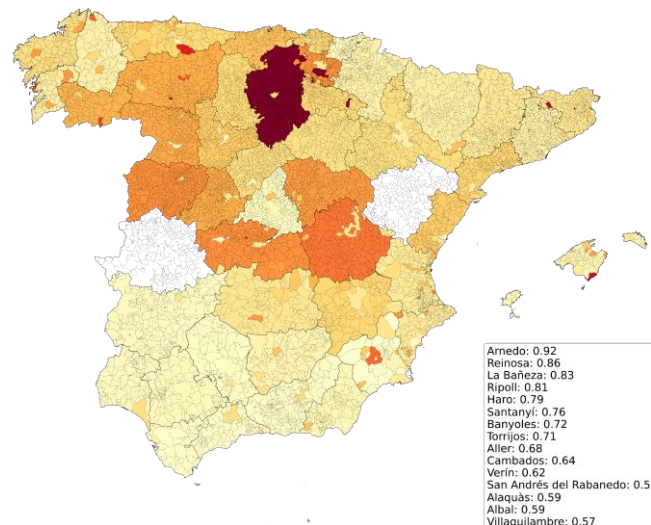

## Nasal fossa

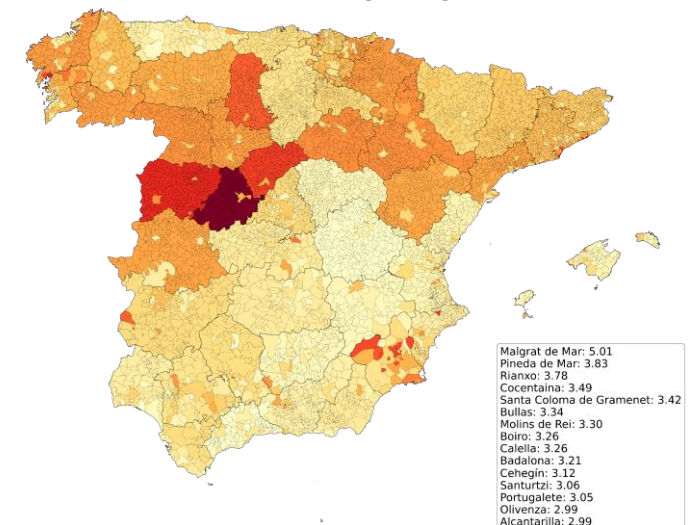

## Other Intrathoracic Organs

## Renal Pelvis

## Other Urinary Organs

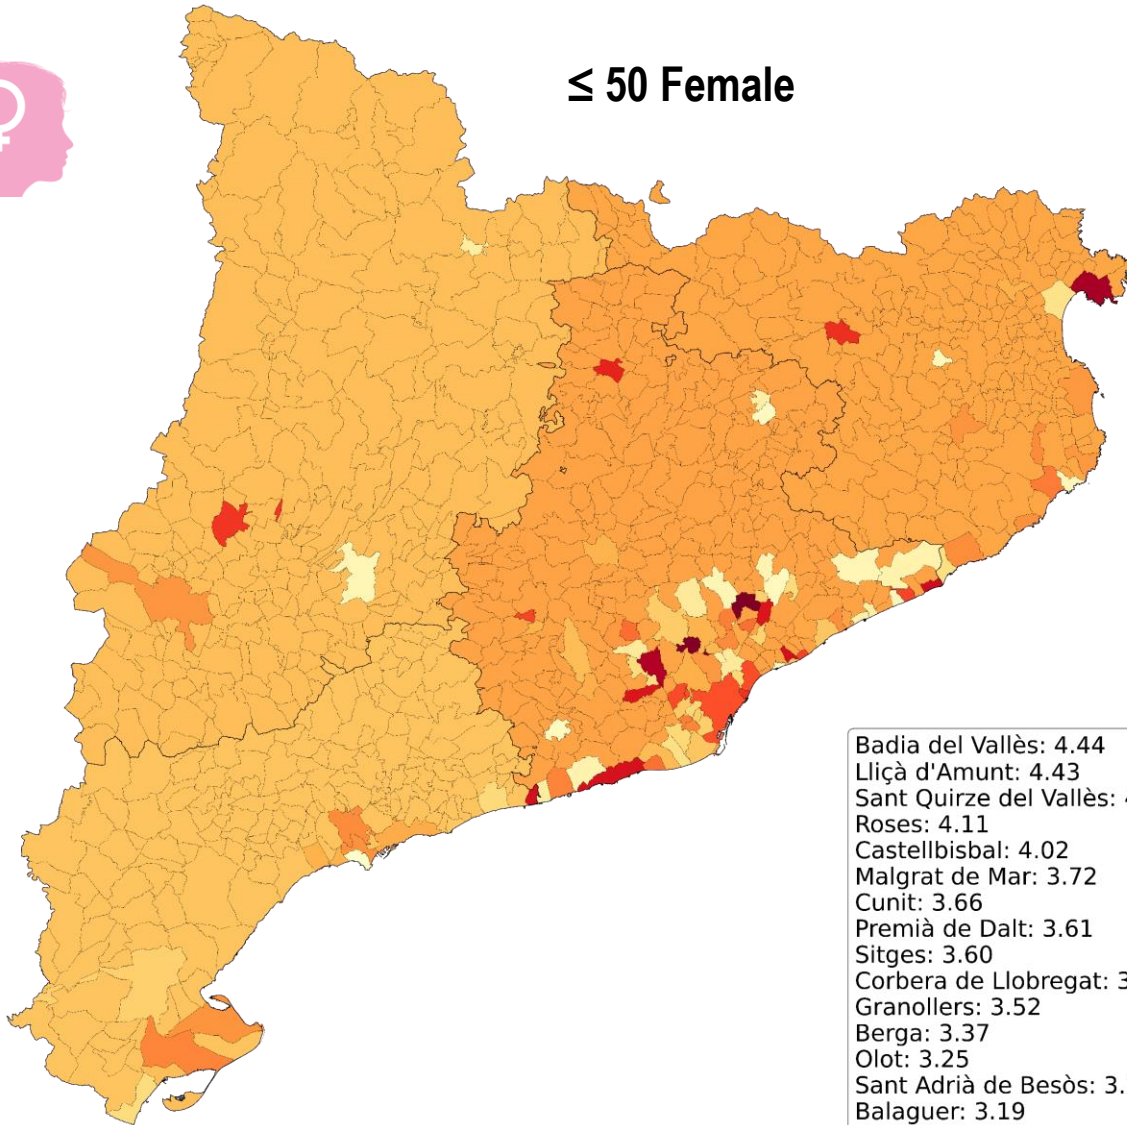

# Results: Lung cancer Age-Standardized Mortality

Granularity level

≤ 50 Female

TO EXPLORE WHAT IS HAPPENING IN THIS AREAS?

HOTSPOT AREAS  
FOR  
PRIORITIZING  
PREVENTION  
STRATEGIES

# Take-home Messages

This ecological study showed correlations between age-standardized death rates for certain solid tumors and Radon areas in Spain, notably in **oropharyngeal & urothelial tumors in young females**

Also, a correlation was found between Rn areas and **thoracic malignancies in young females**, a population typically associated with lower cumulative smoking exposure.

This data can provide useful information to **establish priorities** in cancer prevention strategies (radon & other risk factors)

Further **prospective studies** are currently ongoing to explore the role of radon in patients with cancer, particularly for young pop (*BIORADON, MIRROR, EXPOSOME*)

# Radon: Impact on patients with lung cancer?

## MIRROR

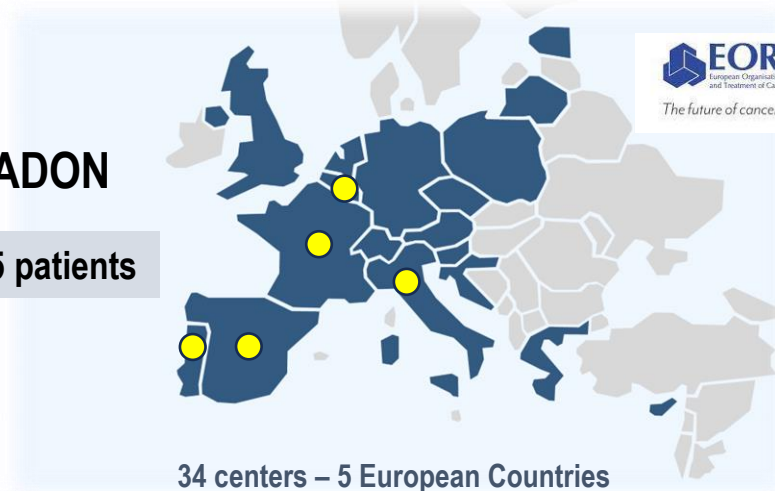

N= 670 patients

14 centers - Spain

## BIORADON

N= 975 patients

34 centers – 5 European Countries

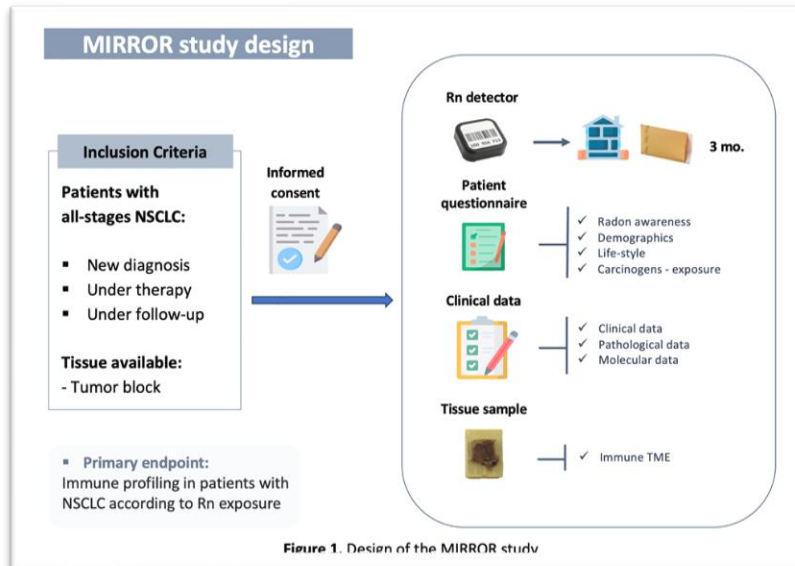

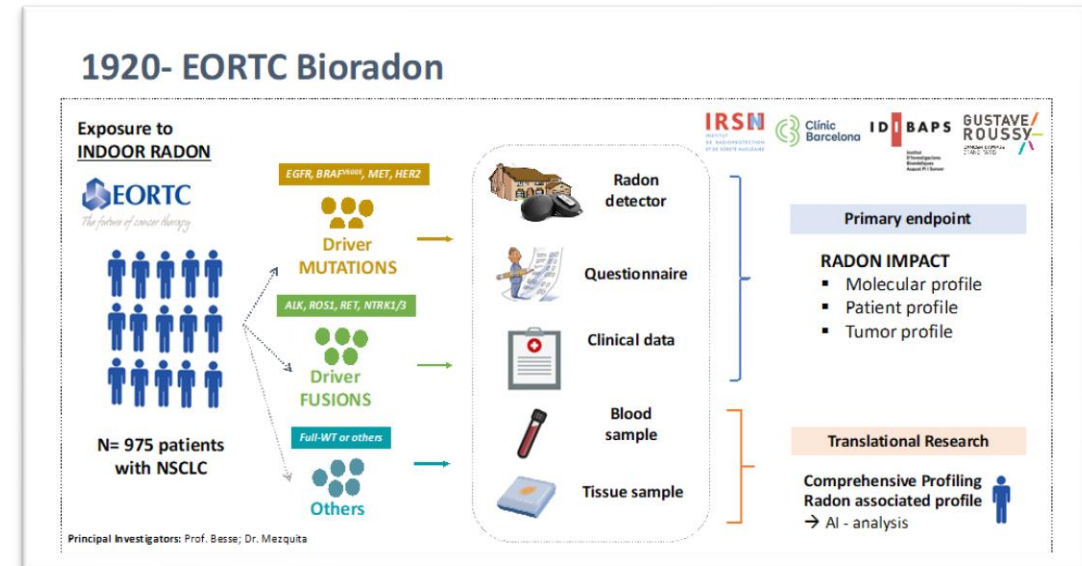

Figure 1. Design of the MIRROR study
