## Continuum-Discretized Coupled Channel description of (d,p) reactions with nonlocal optical potentials

*Tuesday 28 June 2022 17:05 (5 minutes)*

Treating deuteron breakup in (d,p) reaction requires solving three-body Schrodinger equation with nucleon optical potentials. According to a general theory of optical potentials they should be nonlocal. We present two approximate methods to account for this nonlocality within the Continuum-Discretized Coupled Channel (CDCC) method: (1) we derive a leading-order local-equivalent CDCC model and (2) we solve the CDCC equations with velocity-dependent optical potentials that represent nonlocal optical potential in the next-to-leading order. Examples of numerical calculations will be given.
