#### **Introduction to Machine Learning**

Christophe Rappold christophe.rappold@csic.es

IEM – CSIC

24 January 2025

A subset of artificial intelligence in the field of computer science that often uses statistical techniques to give computers the ability to "learn" with data, without being explicitly programmed

Samuel Arthur -1959 -ML in Checkers

• Definition "to learn" from dictionary:

"Gain knowledge or understanding of, or skill in by study, instruction or experience"

- Learning a set of new facts
- Learning how to do something
- Improving ability of something already learned

## What is Machine Learning?

#### • Why learning ?

 Machine learning is programming computers to optimize a performance criterion using example data or past experience

#### - Learning is used when :

- Human expertise does not exist
- Humans are unable to explain their expertise
- Amount of knowledge is too large for explicit encoding
- Solution changes in time
- Relationships can be hidden within large amounts of data
- Solution needs to be adapted to particular cases
- New knowledge is constantly being discovered by humans

The automatic extraction of semantic information from raw signal is at the core of many applications (object recognition, speech processing, natural language processing, planning, etc).

#### Can we write a computer program that does that?

• The (human) brain is so good at interpreting visual information that the gap between raw data and its semantic interpretation is difficult to assess intuitively:

This is a mushroom.

#### This is a mushroom.

C. Rappold – Intro to ML

This is a mushroom.

...,

- Extracting semantic information requires models of high complexity.
  - Cannot write a computer program that reproduces this process.
  - However, can write a program that learns the task of extracting semantic information.
- A common strategy to solve this issue consists in:
  - Defining a parametric model with high capacity
  - Optimizing its parameters by "making it work" on the training data

#### Learning $\rightarrow$ tuning the many parameters of the model

#### Machine learning is ...

Finding patterns or associations that can be used to make prediction

- ML is general term  $\rightarrow$  many algorithms / methods
- Big Picture Goal : Learning useful generalizations

#### **Fields cross sections**

11

## **Statistics vs Machine Learning**

- Largely overlapping fields:
  - Both concerned with learning from data
  - Philosophical difference on 'focus' and 'approach'.
- Statistics:
  - Founded in mathematics
  - Drawing valid conclusions based on analyzing existing data.
    - Making inference about a 'population' based on a 'sample'
    - Tends to focus on fewer variables at once.
    - Precision and uncertainty are measures of model goodness.
- Machine Learning:
  - Founded in computer science
  - Focused on making predictions or seeking patterns (generalization).
    - Often considers a large number of variables at once.
    - Prediction accuracy to measure model goodness.

## **Classic example or has become a classic**

- Recognition of handwritten digits
  - MNIST database (Modified National Institute of Standards and Technology database)
  - 60k training images and 10k testing images labeled with correct answer
  - 28 pixel x 28 pixel
  - Algorithms have reached "near-human performance"
  - Smallest error rate (2018): 0.18%

https://en.wikipedia.org/wiki/MNIST\_database

#### **Image recognition**

- ImageNet database:
  - 14 million images, 22,000 categories
  - Since 2010, the annual ImageNet Large Scale Visual Recognition Challenge (ILSVRC): 1.4 million images, 1000 categories
  - In 2017, 29 of 38 competing teams got less than 5% wrong

#### **Diffusion model**

R. Rombach et al. *Stable diffusion* (2022) ArXiv:2112.10752 can you give an short example of output of chatGPT for illustrating it to master students in nuclear physics

Here is an example of an output of ChatGPT that could be used to illustrate the capabilities of the model to master students in nuclear physics:

"ChatGPT is a powerful language model that can understand and generate scientific text. For example, it can generate a brief explanation of a nuclear physics concept such as beta decay:

"Beta decay is a type of radioactive decay in which a beta particle (an electron or a positron) is emitted from the nucleus of an atom. This process changes the atomic number of the atom, resulting in the formation of a different element or isotope. Beta decay is an important process in nuclear physics as it plays a role in the production of elements in stars and in the decay of certain radioactive isotopes used in medical and industrial applications."

This output provides a clear and concise explanation of beta decay, demonstrating the model's ability to understand and generate scientific text relevant to the field of nuclear physics.

#### Large Language models

OpenAl, *ChatGPT (2022)* https://openai.com/models/gpt-3/

## Some successes and unsolved problems in Al

#### • From a textbook in 2020:

M. Woolridge, The Road to Conscious Machines

Arithmetic (1945)	Forty		
Sorting lists of numbers (1959)	Edsy		
Playing simple board games (1959)	]		
Playing chess (1997)			
Recognizing faces in pictures (2008)			
Usable automated translation (2010)	a lot of effort		
Playing Go (2016)			
Usable real-time translation of spoken words (2016)	J		
Driverless cars	Pagl progress		
Automatically providing captions for pictures	Redipiogress		
Understanding a story & answering questions about it			
Human-level automated translation			
Interpreting what is going on in a photograph	Nowhere near		
Writing interesting stories	solved		
Interpreting a work of art			
Human-level general intelligence	J		

What was done in last 4 years !

- Image recognition
- Speech recognition
- Recommendation systems
- Automated translation
- Chatbots based on Large Language Models

#### 24/01/2025

## **Types of Machine learning**

24/01/2025

## **Unsupervised learning**

- Important aspects :
  - <u>No</u> Labels or targets
  - No feedback
  - Find hidden structures

## **Unsupervised learning**

- Main algorithms:
  - Clustering
    - Hierarchical cluster analysis
      - Needs one metric  $(||.||_2)$
      - linkage criteria: d between clusters as a function of the d between observations ( complete-linkage clustering max{d(a,b):a∈A,b∈B})

22

## **Unsupervised learning**

- Main algorithms:
  - Dimensionality reduction → Several aspects
    - high-dimensional datasets & the "curse of dimensionality"
      - When dimension UP, volume space unit hypercube UP, dataset become very sparse  $\rightarrow$  problematic for statistics significance
        - 1D, unit interval & 100 uniformly distributed sample: distance spacing is 10<sup>-2</sup>

- 10D unit hypercube, for same lattice spacing needs 10<sup>20</sup> samples.
- Reduce dimension of dataset
  - $\rightarrow$  Feature extraction: pre-processing steps for other algorithms
  - $\rightarrow$  Data visualization: sometimes it is nice to also see the data

- Important aspects :
  - Labeled data
  - Direct feedback
  - Predict outcome

#### Naive approach

- Observe what is a spam and detect recurrent patterns
- write an algorithm of these patterns
- If a new email contains these patterns then classify it as a spam
- iterate until convergence

- Complex task
- High nb of rules
- Difficult to update

• Machine learning

1. A ML spam filter automatically learns relevant patterns

• Machine learning

1. A ML spam filter automatically learns relevant patterns

2. Automatic adaptation

- Machine learning
  - 1. A ML spam filter automatically learns relevant patterns
  - 2. Automatic adaptation
  - 3. Can help humans to learn  $\rightarrow$  Data Mining

• Workflow

24/01/2025

C. Rappold – Intro to ML

- Instance: A specific observation of data.
- <u>Feature</u>: An measurable property of instance.
- <u>Criterion/Outcome</u>: The feature that you want to predict.
- <u>Model</u>: Representation or simulation of reality. Typically a simplification based on assumptions

- Main algorithms:
  - Decision Trees :
    - The criterion is modeled as a sequence of logical TRUE or FALSE
    - Recursively partitions the feature space such that the samples with the same labels or similar target values are grouped together.
    - Minimize the impurity:

$$G = \frac{N^{left}}{N} H(Set_{left}) + \frac{N^{right}}{N} H(Set_{right})$$

- Main algorithms:
  - Artificial neural network
    - The biological inspiration: the neuron
    - C. elegans (roundworm):
      - 302 neurons
      - with ~ 25 synaptic connections
    - Human brain:
      - 10<sup>11</sup> neurons
      - with ~ 7000 synaptic connections
    - <u>Weighting</u> Inputs signals
    - Passing through an activation

#### Perceptron

• Idea already from Rosenblatt, 1954:

- Perceptron: designed for image recognition
  - It was first implemented in hardware with 400 photocells, weights = potentiometer settings
  - Based on the first mathematical model of a biological neuron of McCulloch–Pitts (1943)

THE MARK I PERCEPTRON

#### Improvements on the concept

• Non-linear transfer via activation function:

- Example for h: sigmoid  $\frac{1}{1+e^{-x}}$
- Non-linear activation function: when feature space is not linearly separable
- linear activation functions is just a perceptron

#### **Feed Forward Neural Network**

superscripts indicates layer number

34

$$\phi_i(\vec{x}) = h\left(w_{i0}^{(1)} + \sum_{j=1}^n w_{ij}^{(1)} x_j\right)$$

$$y(ec{x}) = h\left(w_{10}^{(2)} + \sum_{j=1}^m w_{1j}^{(2)} \phi_j(ec{x})
ight)$$

Hidden layer Composed of *neurons* 

Straightforward to generalize to multiple hidden layers

## Try in the browser

24/01/2025

#### Howto?

- Network training:
  - An optimization problem: Find optimal weights to solve my problem
    - $\rightarrow$  Need of a loss function on which we can action to find optimal
      - Example: Squared error loss (regression), Cross entropy (classification)
  - Usage of gradient descent  $\vec{w}^{(\tau+1)} = \vec{w}^{(\tau)} \eta \nabla E_a(\vec{w}^{(\tau)})$
  - Example of a loss landscape of a modern artificial neural network:

H. Li et al. https://papers.nips.cc/paper\_files/paper/2018/hash/ a41b3bb3e6b050b6c9067c67f663b915-Abstract.html

# **Demystify neural networks**

• Full implementation of training of 2-layer NN :

```
import numpy as np
 1
                                                                         1000
                                                                                           100
     from numpy.random import randn
 3
                                                                       x_1
     N, D in, H, D out = 64, 1000, 100, 10
 4
                                                                                          \phi_1
     x, y = randn(N, D_in), randn(N, D_out)
 5
                                                                       x_2
                                                                                                             10
     w1, w2 = randn(D in, H), randn(H, D out)
 6
                                                                                          \phi_2
 7
                                                                       x_3
                                                                                                              h
     for t in range(2000):
 8
      h = 1 / (1 + np.exp(-x.dot(w1)))
 9
                                                                                                     \mathbf{w}^2
      y \text{ pred} = h.dot(w2)
10
      loss = np.square(y pred - y).sum()
                                                                                          \phi_d
11
       print(t, loss)
12
                                                                      x_m
                                                                                \mathbf{W}^1
13
                                                                                           \sigma
14
       grad y pred = 2.0 * (y \text{ pred} - y)
15
       grad_w2 = h.T.dot(grad_y_pred)
       grad_h = grad_y_pred.dot(w2.T)
16
                                                                              Optimization part:
       grad_w1 = x.T.dot(grad_h * h * (1 - h))
17
18
                                                                              gradient descent
19
      w1 -= 1e-4 * grad w1
                                                                              via "back propagation"
      w2 = 1e - 4 * grad w2
20
```

## **Deep Neural Networks**

- As data complexity grows, need exponentially large number of neurons in a singlehidden-layer network to capture all structure in data
- Deep neural networks factorize the learning of structure in data across many layers:
  - Universal approximation theorem (1989): https://link.springer.com/article/10.1007/BF02551274
- Challenges: Hard and slow to train & risk of overtraining

http://neuralnetworksanddeeplearning.com

# **Cooking recipe in ML**

- Get data (loads of them) & good hardware
- Algorithm to choose ?
  - Structured data: "High level" features that have meaning
    - feature engineering + decision trees / Random forests / XGBoost
  - Unstructured data: "Low level" features, no individual meaning
    - deep neural networks / images  $\rightarrow$  convolutional NN
- But pitfalls to be aware of:
  - Data quality : Garbage In  $\rightarrow$  Garbage Out / Missing data ?
  - Underfitting / Overfitting
  - Simplicity don't imply better generalization
  - Appropriate evaluation metric
  - Mistaking correlation for causation & confounding variables
