

Structure Formation in the Universe

Wednesday 29 March 2023 09:00 (30 minutes)

In its most basic form, the highly successful Λ CDM cosmology can be encapsulated in six parameters. Once these parameters are specified, so too is a wide variety of phenomena, from fluctuations in the microwave background to the growth of structure to the evolution of the expansion rate of the Universe. I will review the predictions related to cosmological structure formation, focusing on areas where potential tensions have emerged: these include nonlinear scales at the earliest times and smallest mass scales and comparisons between measurements early and late in the Universe's history.

Author: BOYLAN-KOLCHIN, Mike

Presenter: BOYLAN-KOLCHIN, Mike

Session Classification: SESSION 1: Cosmology and structure formation (CHAIR: Graciela Gelmini-UCLA)

Track Classification: Dark matter and structure in the Universe
