

# **The threat of the deregulation of American Environmental Law onto Americas long term prosperity**

*Friday, 16 January 2026 11:00 (20 minutes)*

The dismantling of environmental regulations poses a significant and irreversible threat to the health, safety, and economic well-being of the American populace. Since their introduction, environmental safeguards have played a crucial role in mitigating the adverse effects of pollution, preserving natural resources, and ensuring public health. The systematic reduction of these regulations have exacerbated the climate crisis, increased exposure to harmful pollutants, and environmental degradation. The current administration's aggressive roll-backs of environmental protections, including weakened air and water quality standards, the promotion of fossil fuel development, and the reduction of climate change mitigation efforts, further intensify these dangers. By prioritizing short-term economic interests, such as bolstering the fossil fuel industry, over long-term environmental sustainability, these policies risk undermining public health, economic stability, and future generations' access to essential natural resources. Moreover, vulnerable communities, particularly low-income and marginalized populations, are disproportionately harmed by the consequences of deregulation, experiencing heightened exposure to environmental hazards and bearing the brunt of climate change impacts. The current administration's stance on environmental deregulation not only deepens social and economic inequalities but also threatens the nation's future health and well-being.
