Fluxes of Cosmic Rays

GZK cut-off

$$p + \gamma_{CMB} \rightarrow N + \pi, E_p \geq 1.1 \times 10^{20} \text{ eV}$$

$$p + \gamma_{CMB} \rightarrow \Delta \rightarrow N + \pi, E_N \geq 2.5 \times 10^{20} \text{ eV}$$

Bottom-up

- A particle penetrating such a cloud from the front can be kicked back, like a tennis ball hit by a racket, with energy larger than its initial value..
- A more efficient and faster process is acceleration by crossing shock fronts generated in explosive phenomena (1st order Fermi mechanism - $\Delta E > 0$). The energy of accelerating particles depends on the value and the size of the magnetic field and is limited by the Larmor radius related to their confinement.
- Many theories and models propose either sophisticated explanations or require some new physics. One of the models explores ultra relativistic shock acceleration such as in hot spots of powerful radio galaxies and **Gamma Ray Bursts**. Relativistic jets are produced perpendicular to the accretion disk around a super-massive black hole in the central part of an active galactic nucleus.

Top-down

- Many theories propose top–down mechanism, decay of super–heavy, super–symmetric or **Grand Unified Theories (GUT)** particles. The only problem is a justification of their existence or their surviving after the Big Bang. They could have survived up to now by some yet unknown mechanism (a very weakly violated quantum number, particles trapped inside huge potential walls called topological defects and released via spontaneous symmetry breaking mechanism),
- Their decay into some $\sim 10^4$ secondary particles (mainly pions) by hadronization of quark – antiquark pairs would easily produce the ZeV energies we need and their decay products would then be dominated by photons (coming from the decay of neutral pions) and neutrinos (decay of charged pions).
- There are a few experimental consequences of this model, which constitute, if observed, a unique and irrefutable signature of the existence of the Grand Unification, a horizon toward which all the modern quantum field theories are supposed to converge, i.e. heavy nuclei would rather exclude the top-down mechanism.

Special Theory of Relativity

$$E = m_0 c^2$$

$$t \rightarrow t' = \frac{1}{\sqrt{1 - \frac{v^2}{c^2}}} \left(t - \frac{v}{c^2} x \right), \quad c^2 t^2 - x^2 - y^2 - z^2 = \text{const}$$

$$x \rightarrow x' = \frac{1}{\sqrt{1 - \frac{v^2}{c^2}}} (x - vt). \quad (x^0)^2 - (x^1)^2 - (x^2)^2 - (x^3)^2 = \text{const}$$

$$u = \frac{u' + v}{\left(1 + \frac{vu'}{c^2}\right)}$$

General Theory of Relativity

$$R_{\mu\nu} - \frac{1}{2} g_{\mu\nu} R + \Lambda g_{\mu\nu} = -\frac{8\pi}{c^4} G T_{\mu\nu}$$

IEEE TRANSACTIONS ON NUCLEAR SCIENCE, VOL. 62, NO. 3, JUNE 2015

993

An Optimization of the FPGA Based Wavelet Trigger in Radio Detection of Cosmic Rays

Zbigniew Szadkowski

Conclusions

- **The wavelet trigger has been successfully implemented into prototype Front-End Board for the surface detector with 5CEFA9F31I7 FPGA from the Cyclone V family,**
- **Simultaneous analysis in real time in two-dimensional time-frequency domain allows an improvement of trigger efficiency and rejection of spurious triggers.**
