Plasma Diagnostics with VIS/IR Cameras

Courtesy of ITER Organization

- High electromagnetic interference
- Turbulent nature of plasma
- Vessel protection requires real-time video analysis

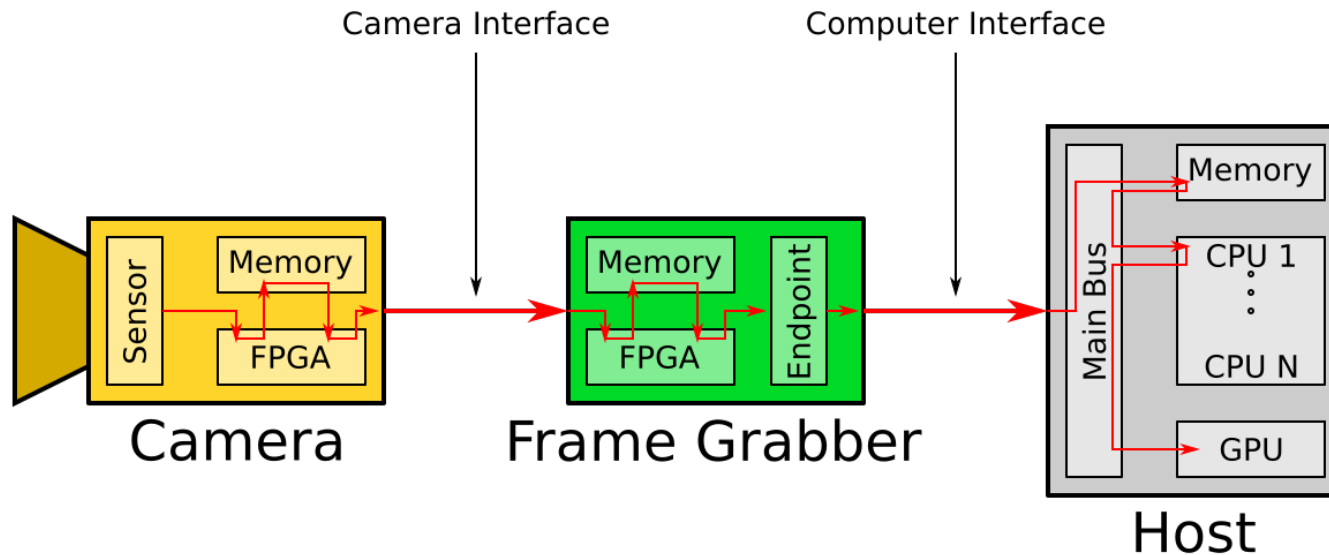

- Non-Uniformity Correction
- Bad Pixel Correction
- Translation to thermal image
- Adaptive thresholding
- Multi-area hot-spot detection
- **Dozens of real-time cameras required**

- Avoid ground loops
- Reduce latency
- FPGA / GPU processing

Regular Approaches to Vessel Imaging

Excessive buffering produces latency

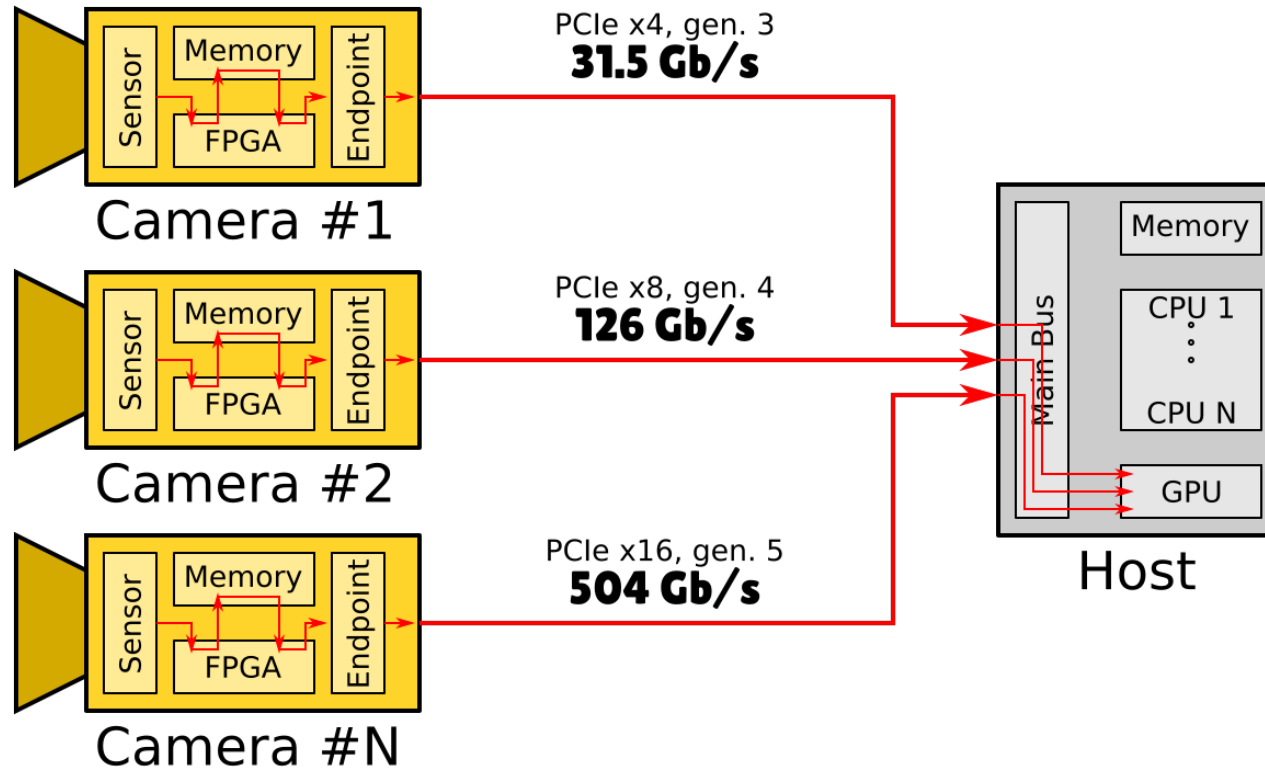

Introducing galvanic isolation often boosts the complexity

The PCIe Solution

- No need for a frame grabber
- Direct transfer to CPU memory or GPU
- Unprecedented bandwidth
- Galvanic isolation without added complexity

Proof-of-concept
