Summary

The Mu3e experiment searches for the lepton flavour violating decay of a muon into two positrons and one electron. The experiment aims for an ultimate sensitivity of one in 10^{16} decays. The highly granular detector based on thin high-voltage monolithic active pixel sensors (HV-MAPS) and scintillating timing detectors will produce about 100GB/s of data. This poster presents the ongoing integration of the sub detectors into the Field Programmable Gate Array (FPGA) based readout system which is used to sort and transport the data to the filter farm. Integration test-beam campaigns are conducted to test and integrate the different detector systems.

The Mu3e experiment

- Search for $\mu^+ \rightarrow e^+e^+e^-$
- Standard Model (SM) via neutrino mixing BR $< 10^{-54}$
- Observation of $\mu^+ \rightarrow e^+e^+e^-$
 - Physics beyond SM
- Signal has one electron, two positrons from one vertex
- Random combinations as background from Michel decays with Bhabha scattering and photon conversion
- SM background with BR $< 3.4 \cdot 10^{-5}$
 - suppress background with good vertex, timing and momentum resolution
- High rates of 10^8 to 10^9 muons/sec
- Excellent momentum resolution regardless low momentum of electrons

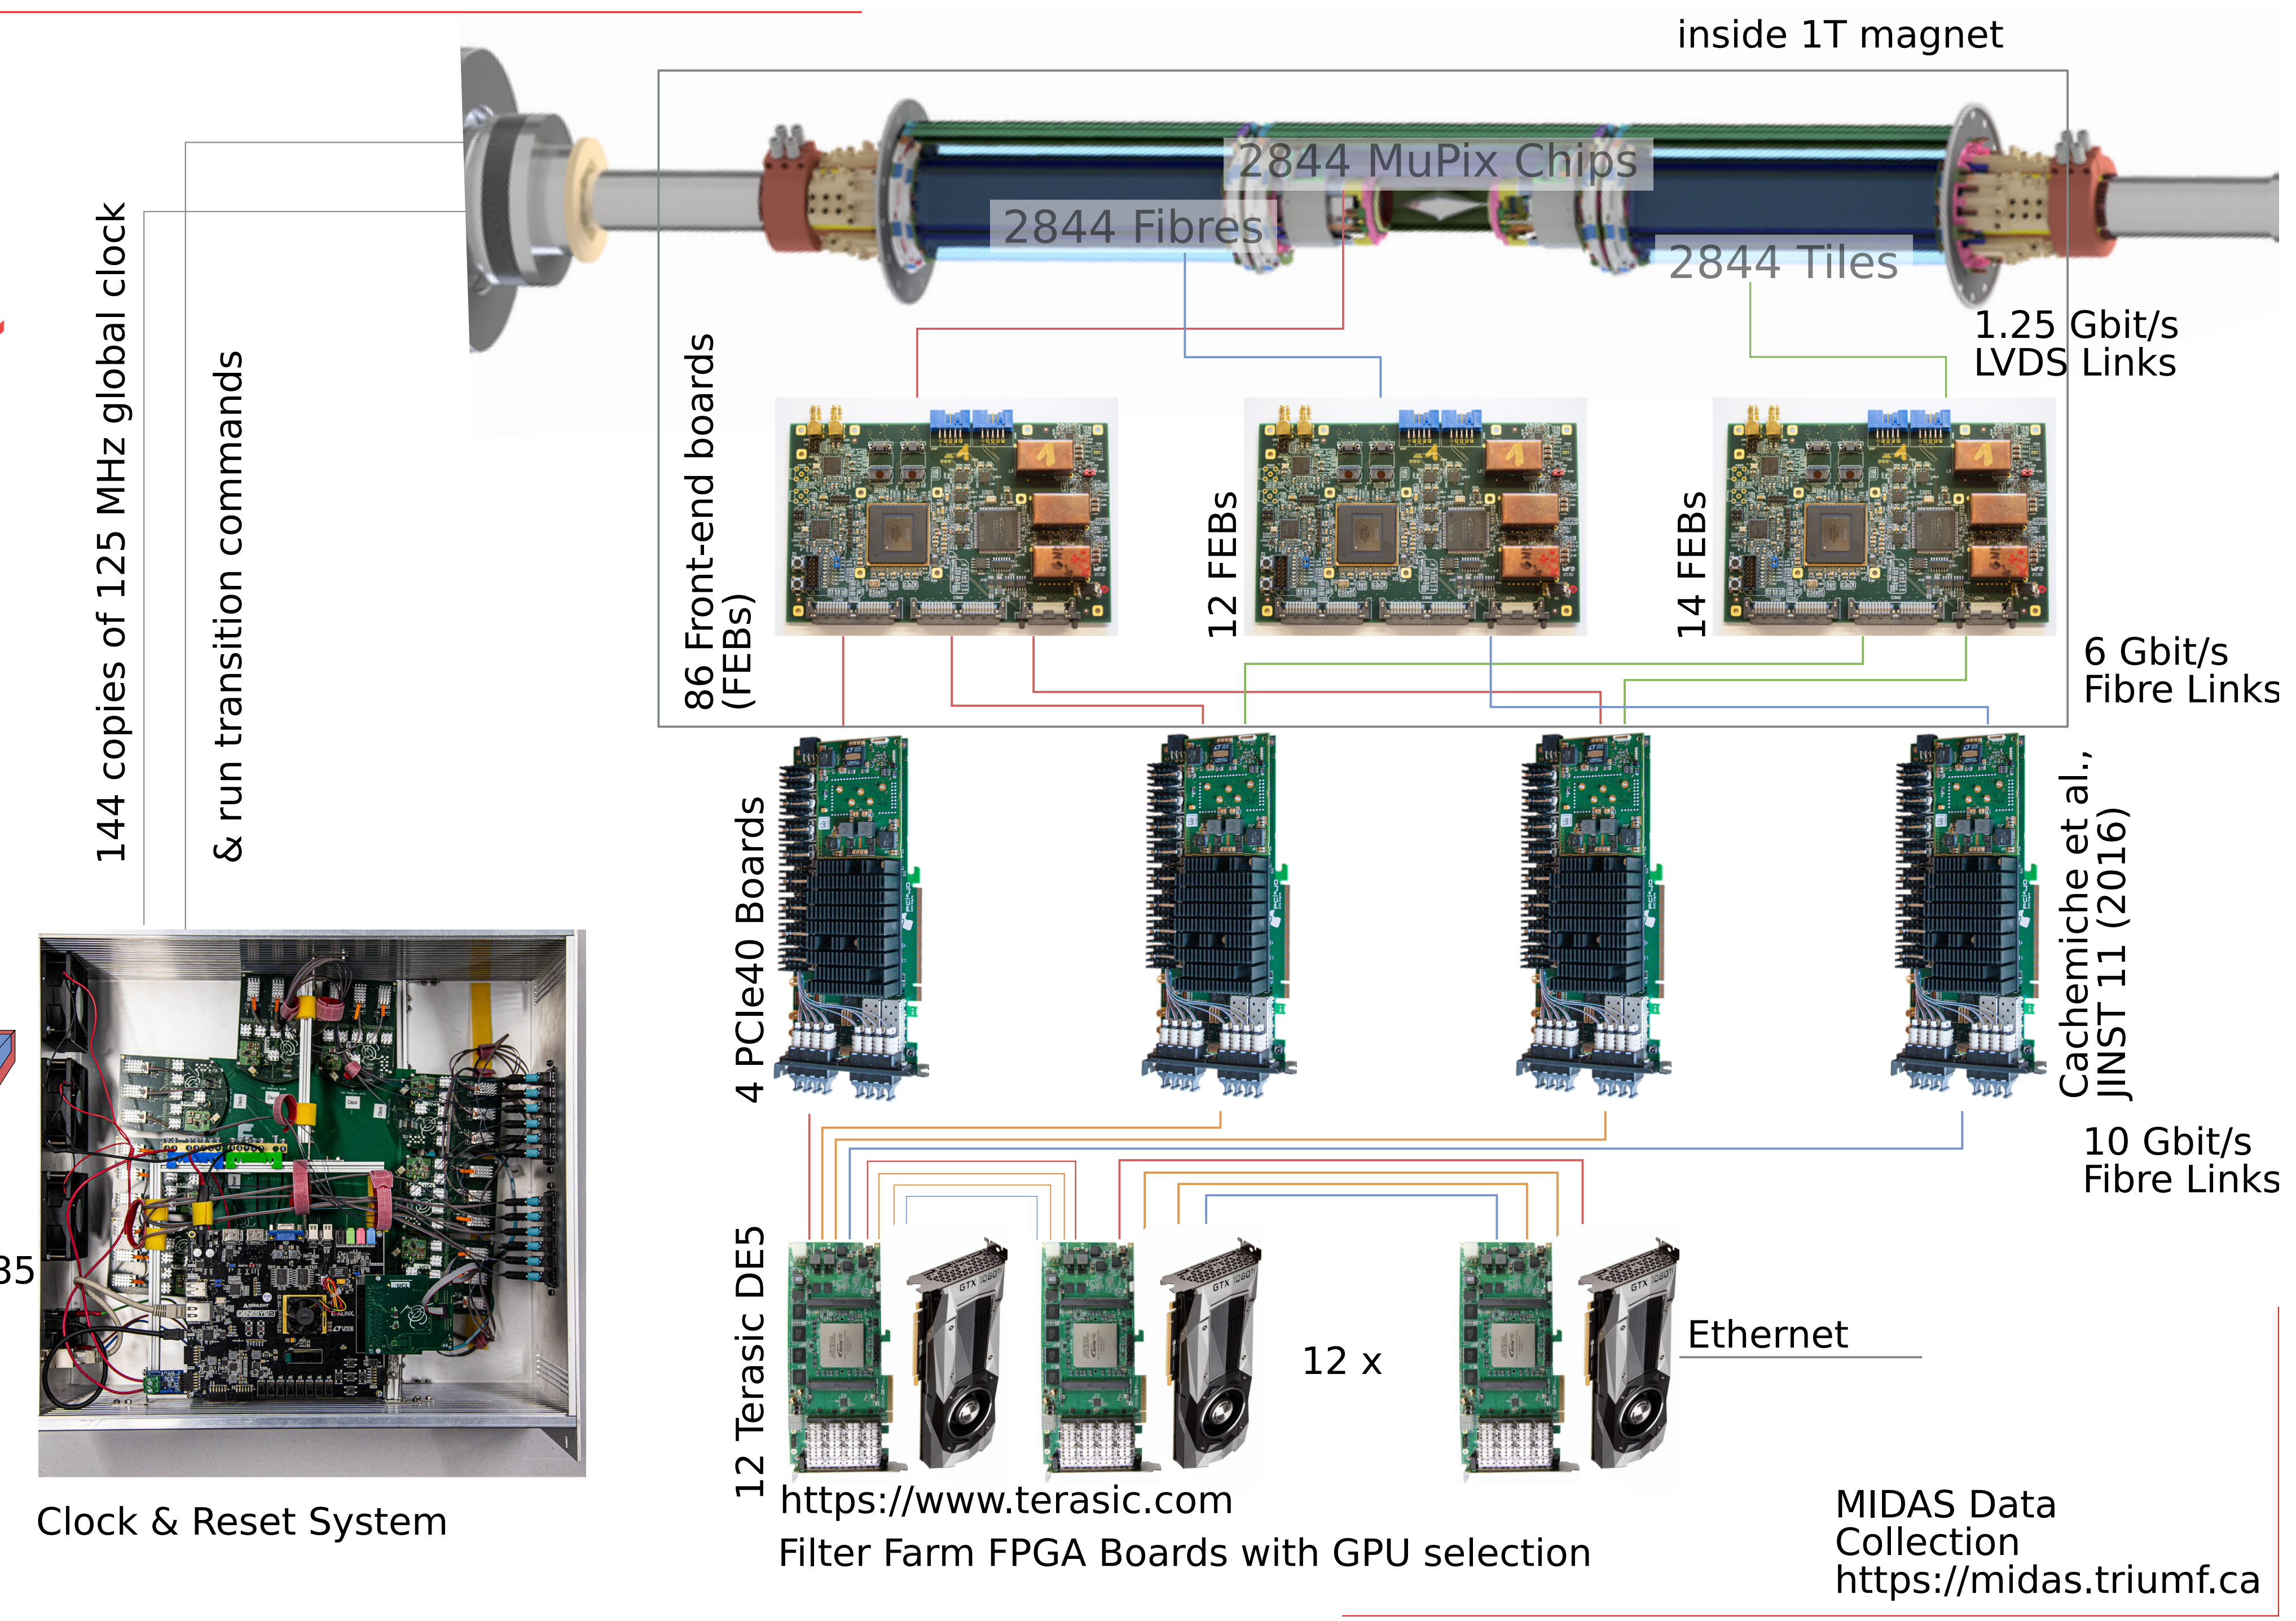

The Mu3e DAQ

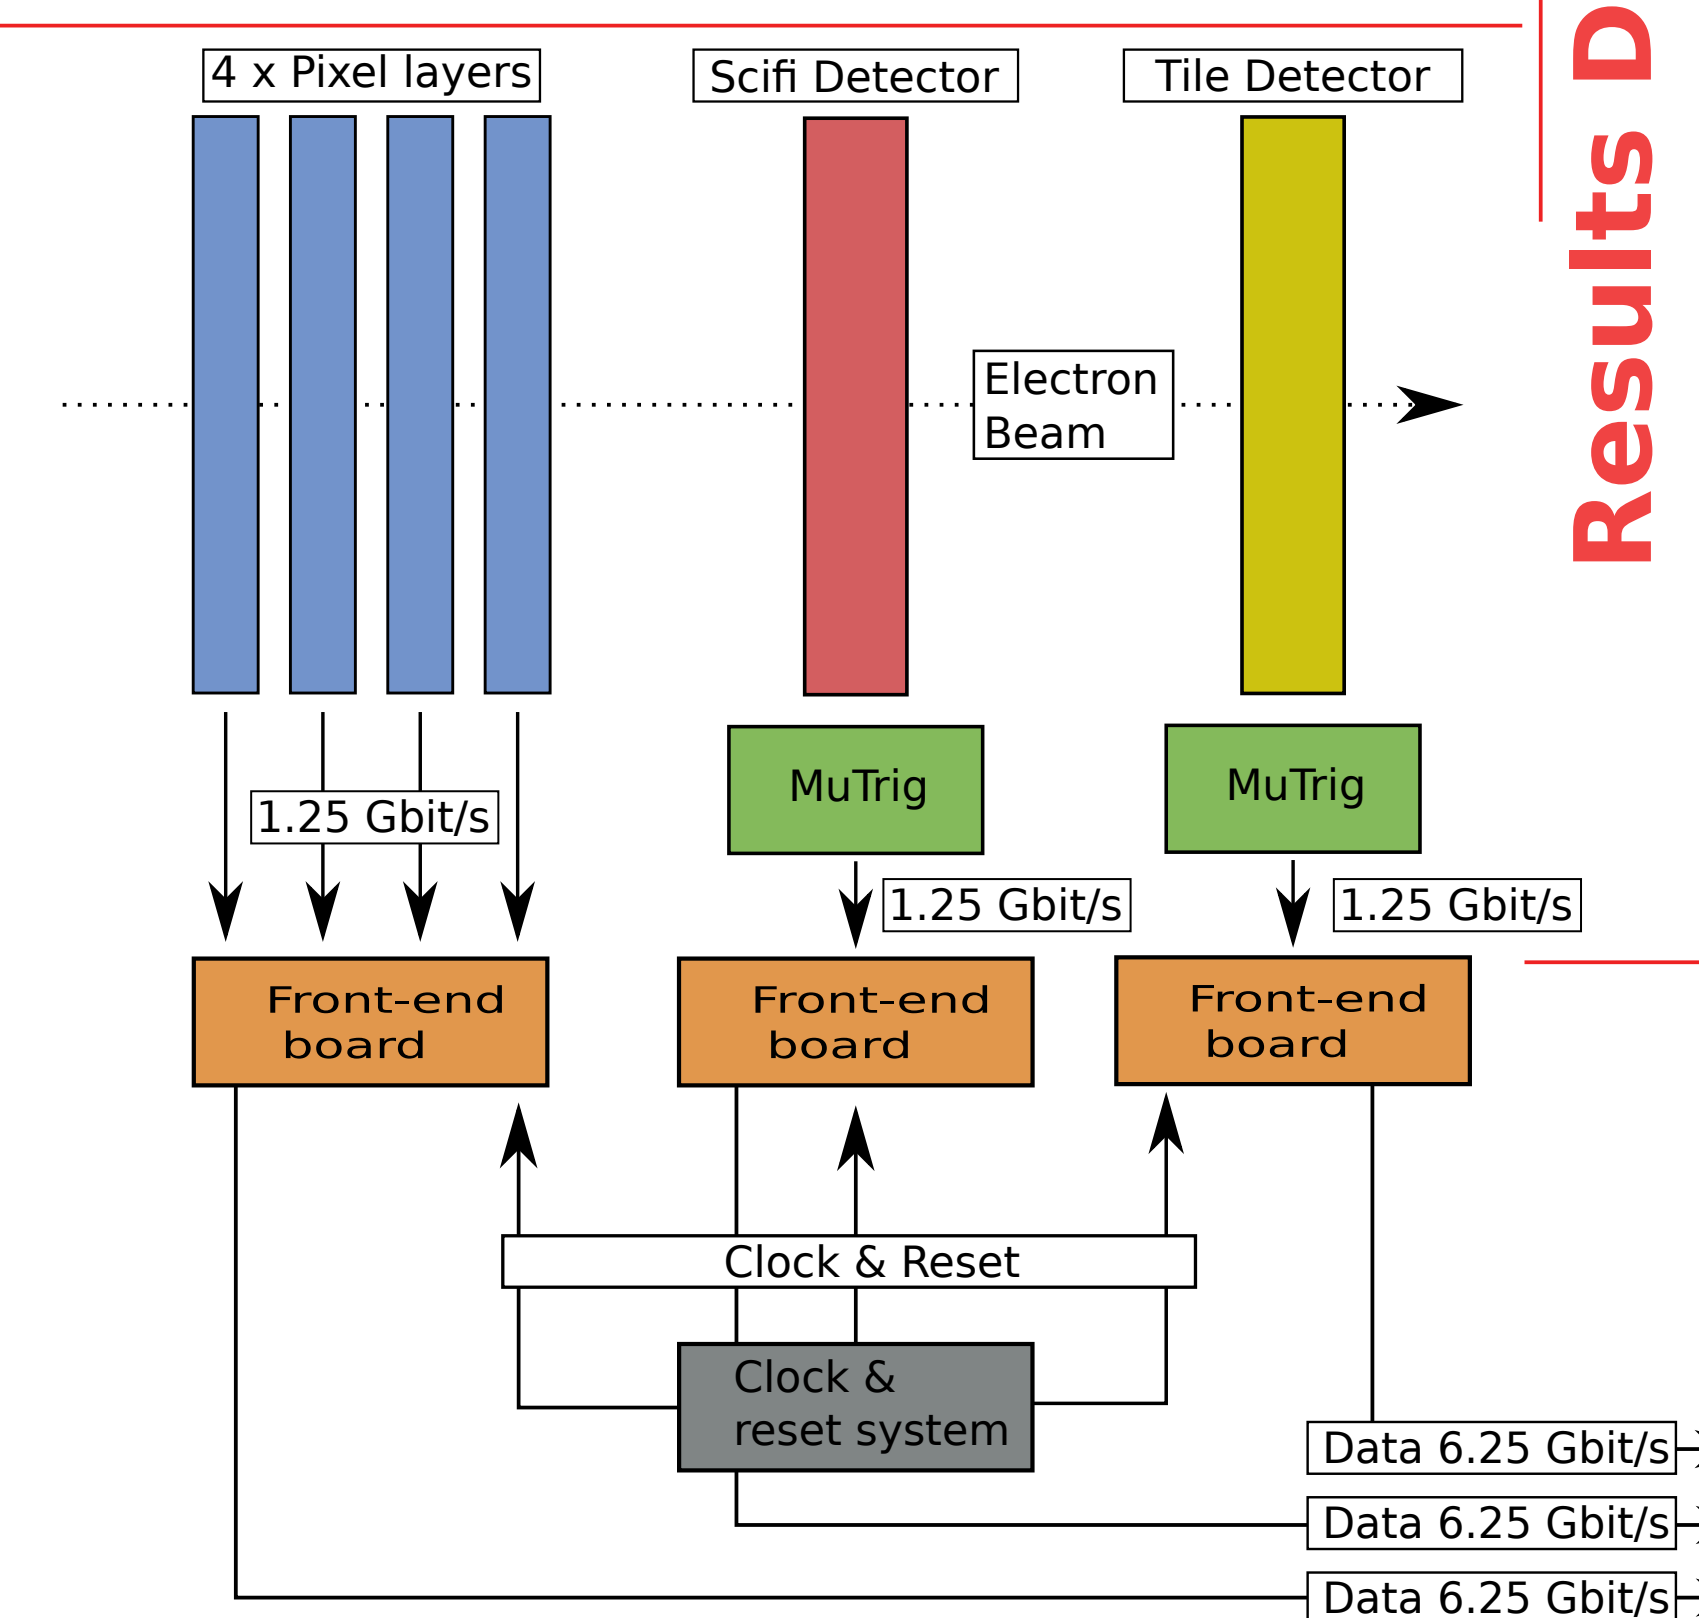

- Thin Si pixel sensor $50 \mu\text{m}$ MuPix
 - Fast charge collection
 - Integrated readout electronics
- Ivan Perić et al. NIM A582 (2007) 876-885

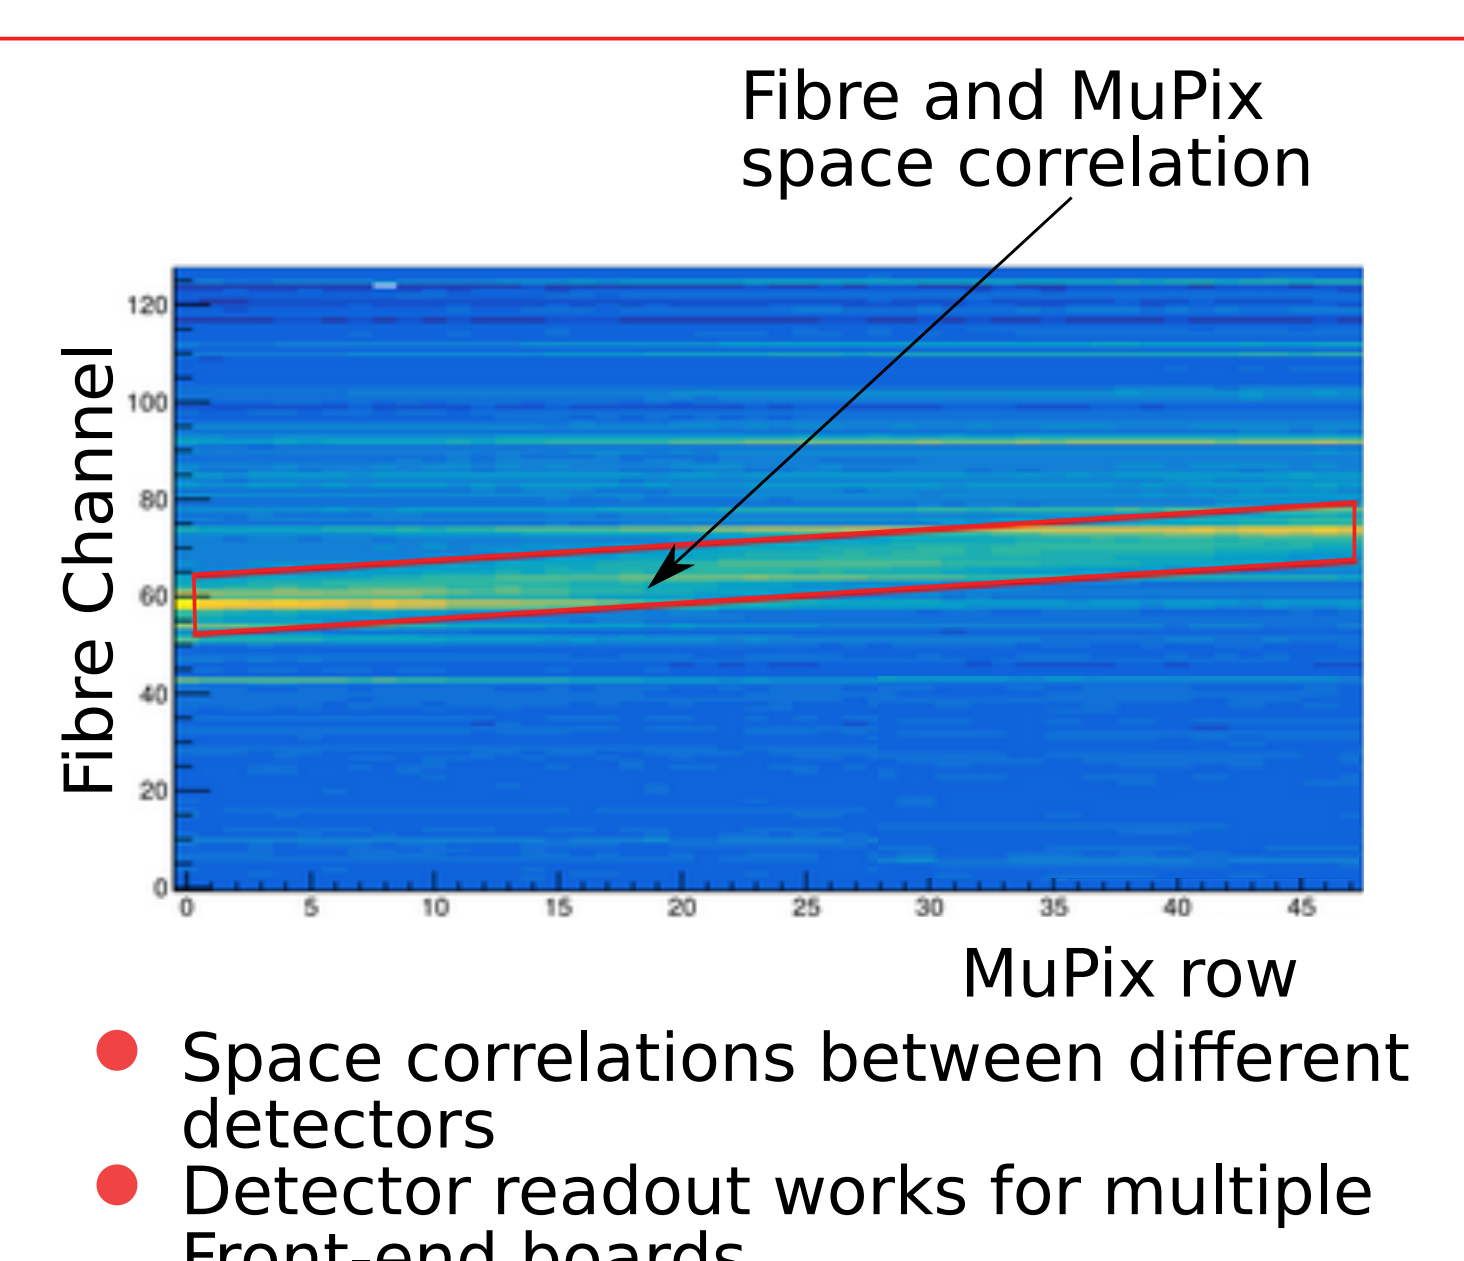

The Mu3e DAQ

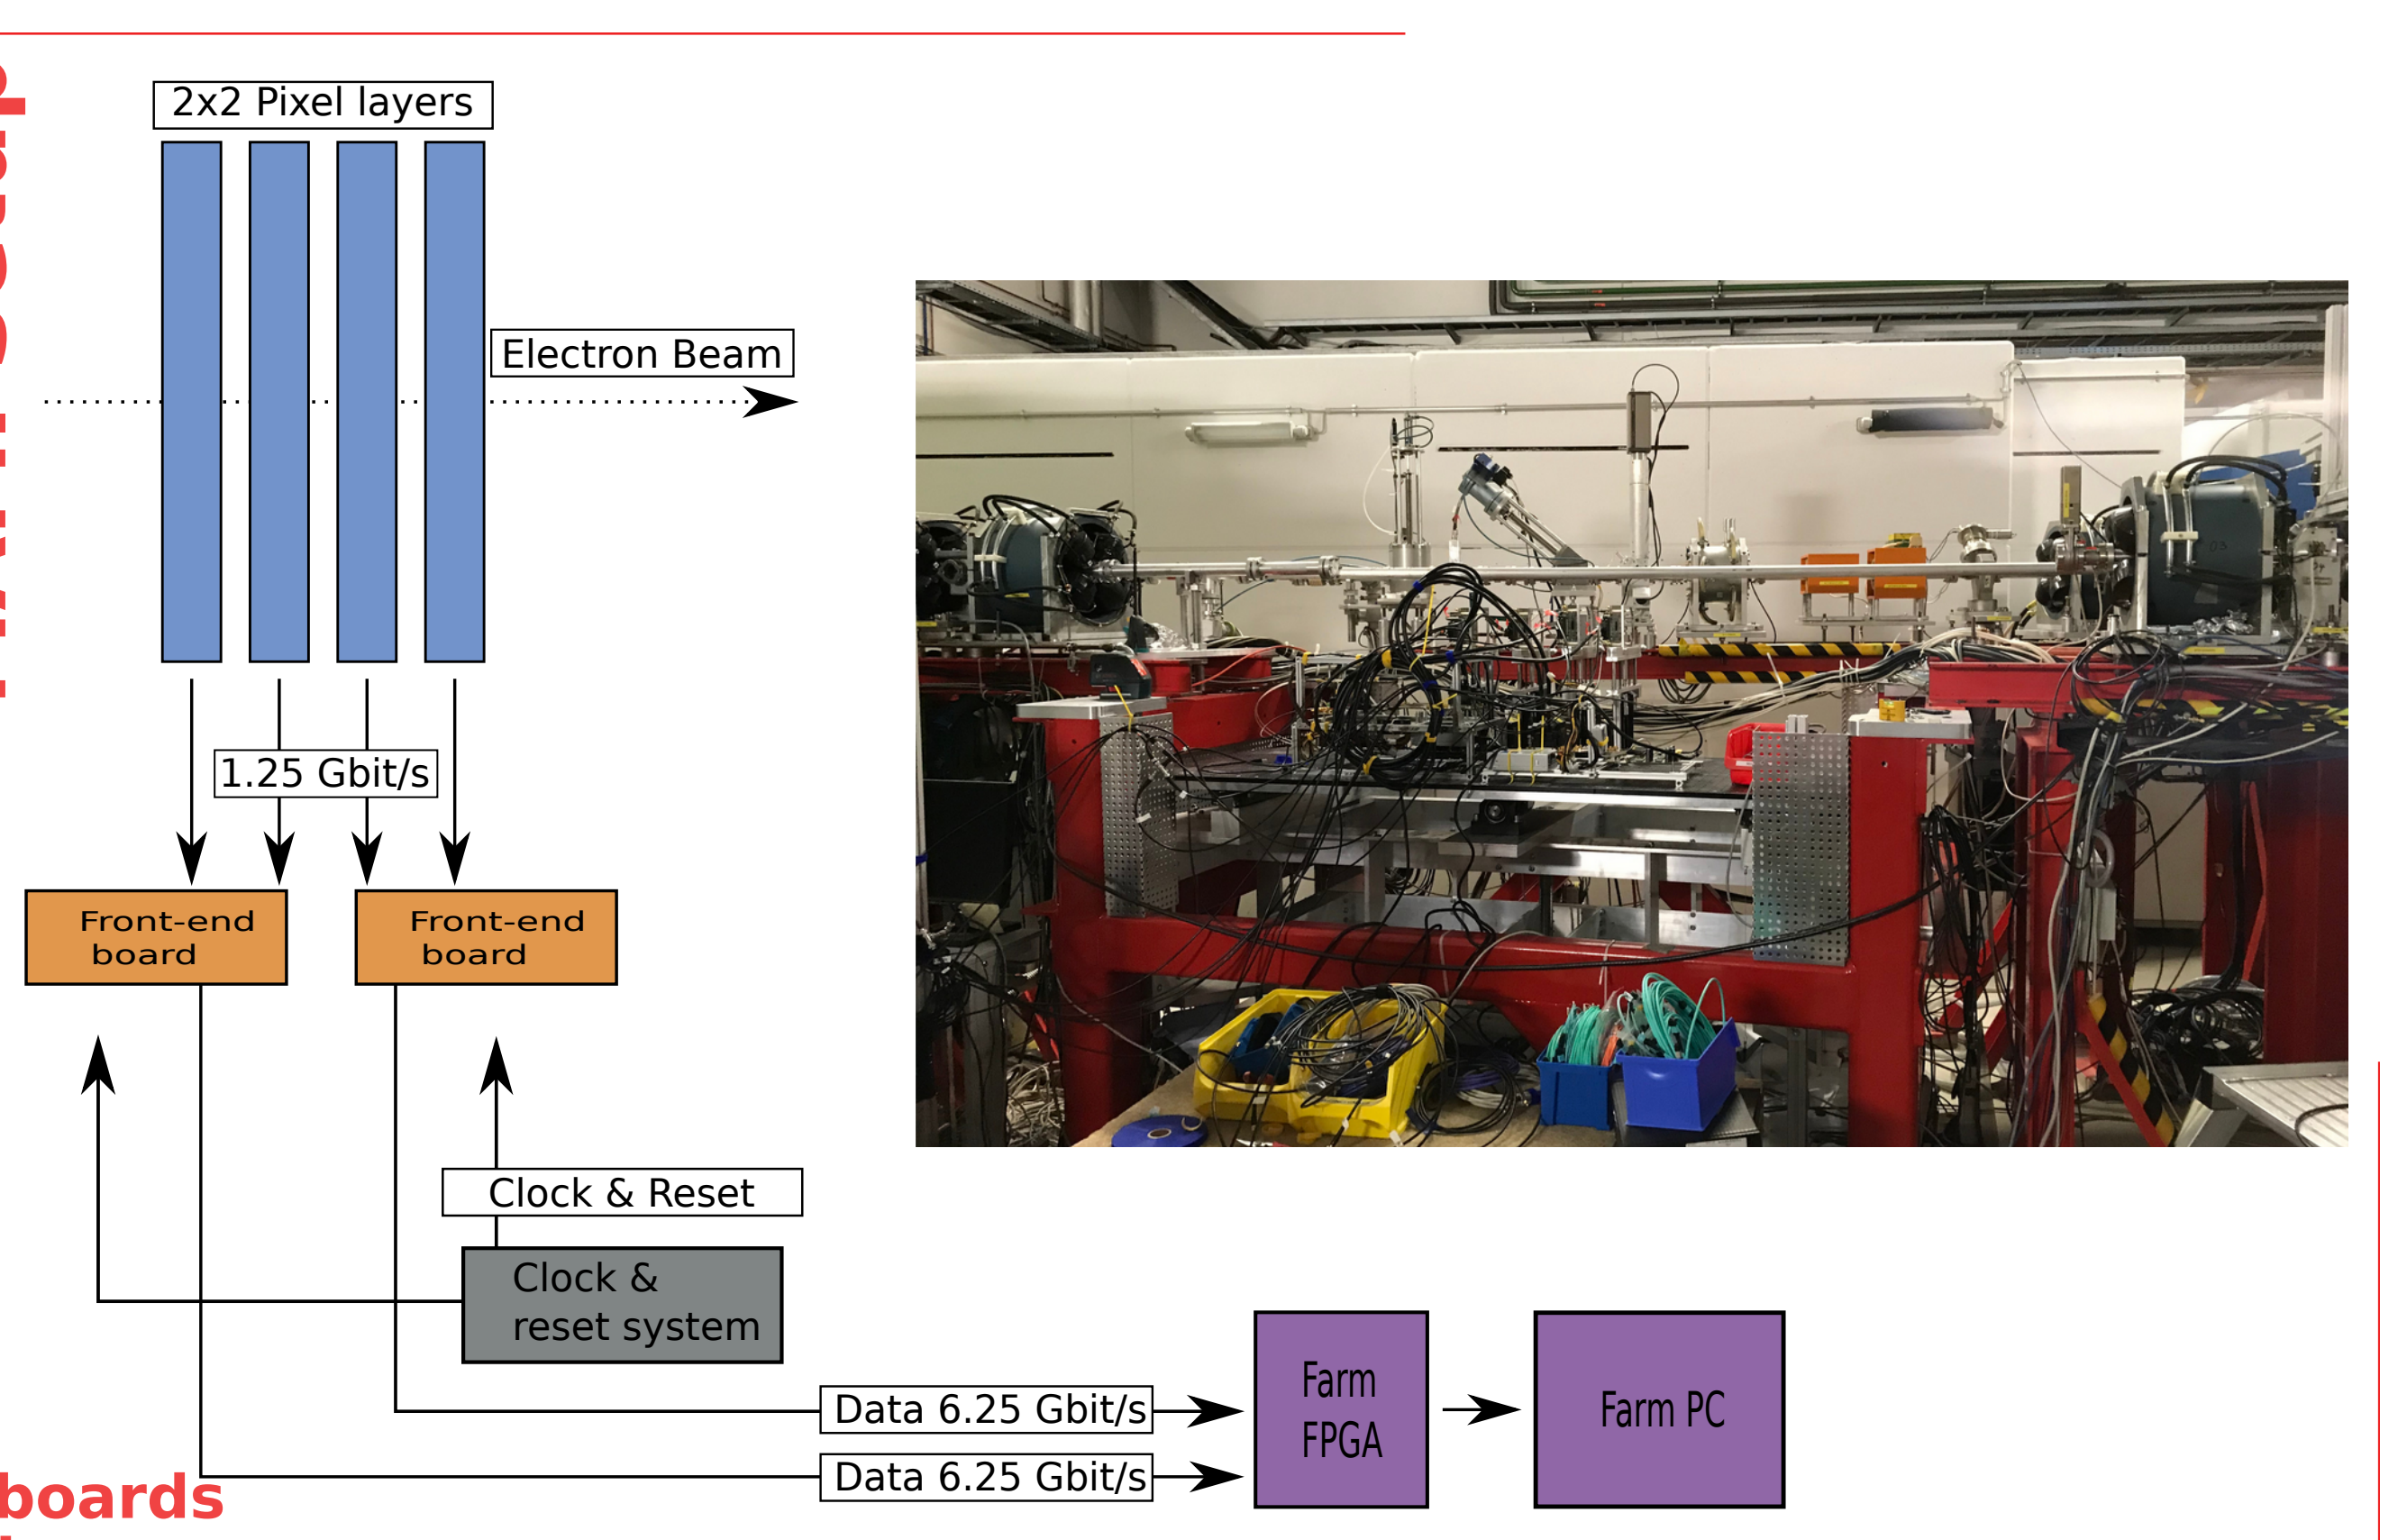

DESY Setup

Results DESY

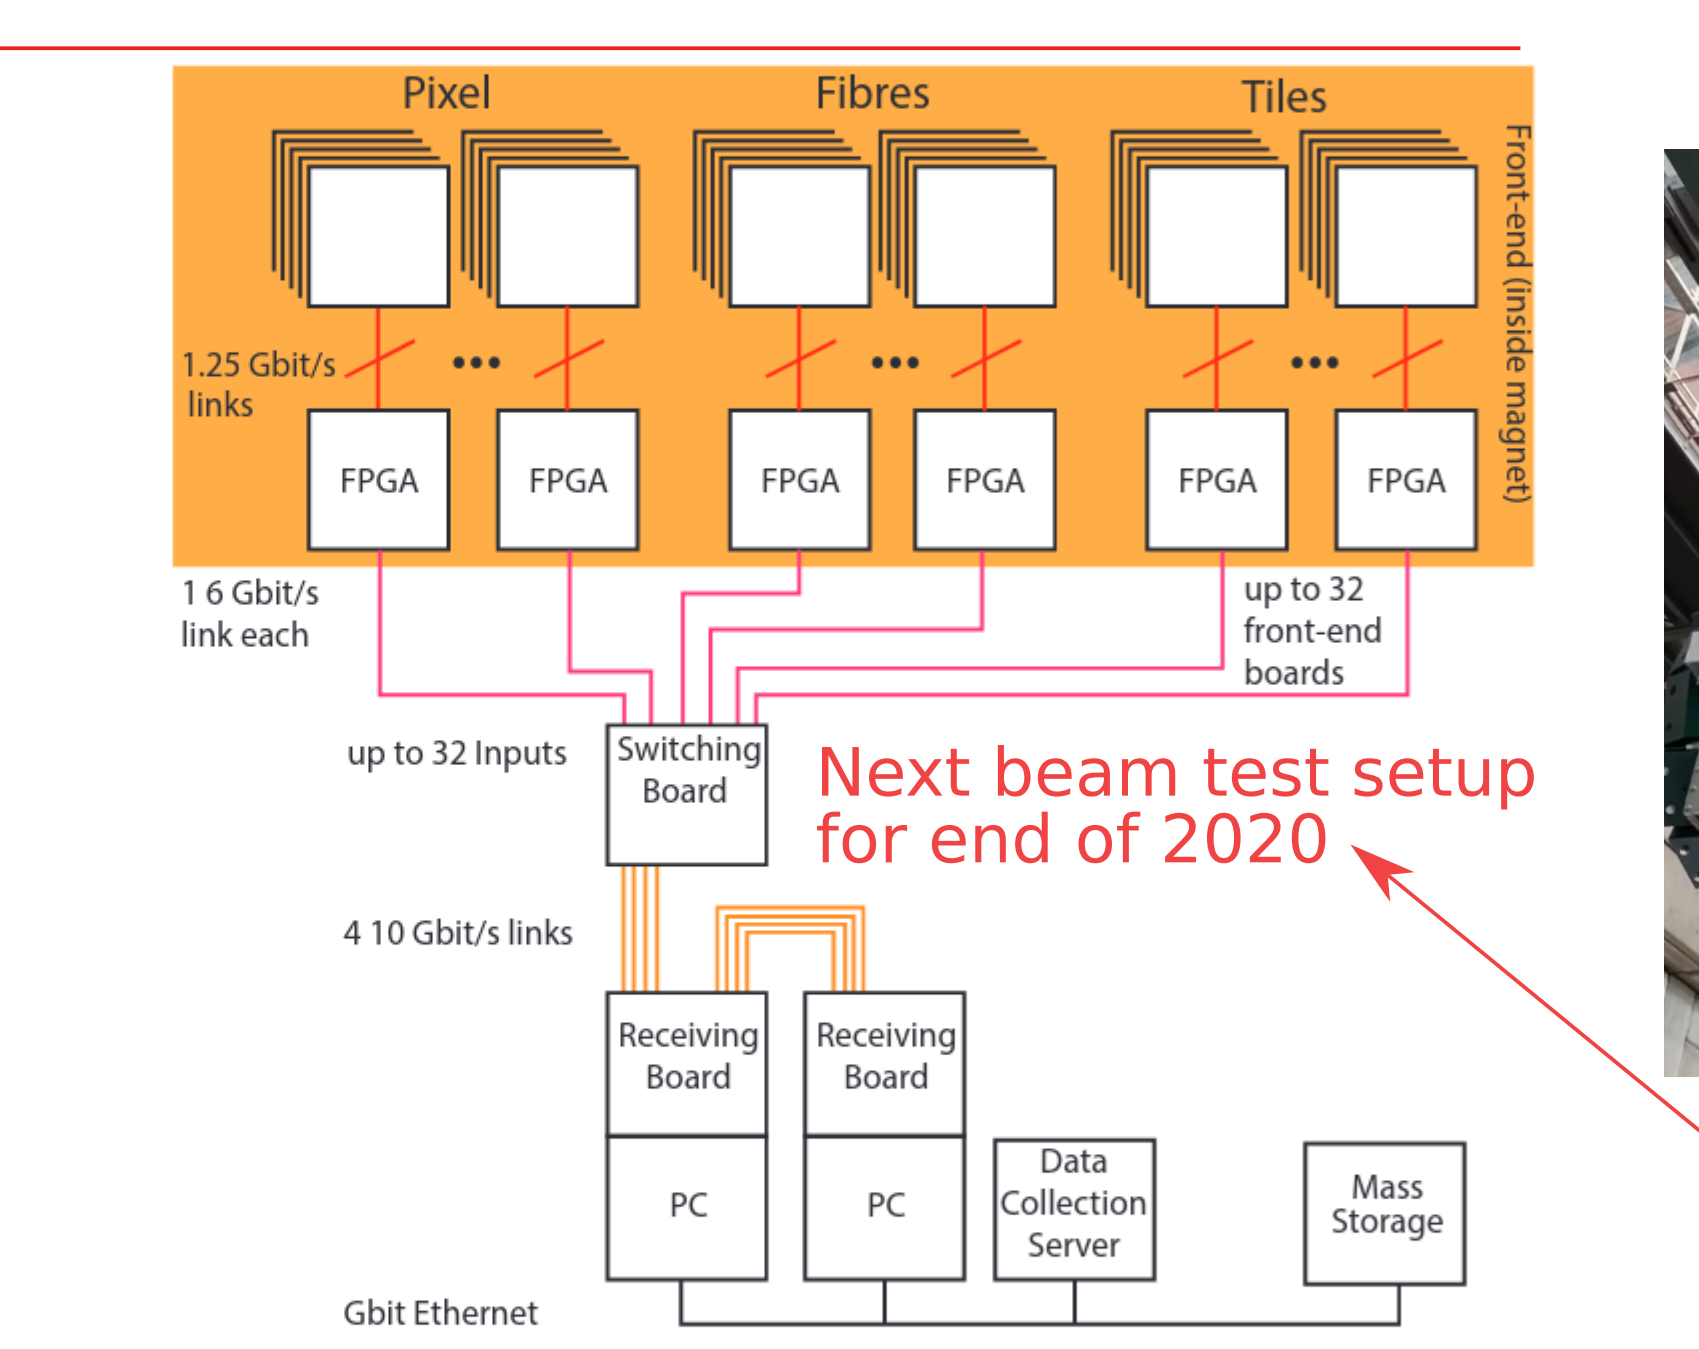

MAMI Setup

Current Status: Working DAQ system for multiple Front-end boards and different detector types

Outlook

Further tests: Scaling up the DAQ system Testing system inside 1T Magnet

Results MAMI
