# Ethernet readout system

## Front-End to Readout:

- Detector electronics transmits data over 10 Gbps links
- Those are aggregated into 100 Gbps links via switches
- 100Gbps links are fed to Readout Units with COTS NICs
- Total throughput (4 DUNE Far Detectors): ~30 Tbps

## Readout requirements:

- Process every frame for hit finding and produce Trigger Primitives for Trigger system
- Buffer data in DRAM for ~10 seconds
- Persist data on NVMe up to 100 seconds

# Implementation and performance

- High throughput software for multi 100Gbps JUMBO UDP Ethernet readout with COTS hardware
- Based on DPDK and use-case specific optimizations

- Extensive performance evaluation

- Wide range of hardware and resource topologies

- Readout with all features in operations

- DUNE prototypes at CERN and ICEBERG
- No data loss, trigger primitives, SNB buffers included
