## Design of compact and repetitive pulsed e-beam source

*Wednesday 21 June 2017 11:15 (15 minutes)*

We report on the design of a compact and repetitive pulsed e-beam source. This pulsed e-beam source, which can work stably for long time, was built based on Marx technology. The designed output voltage, current, pulse width and repetition frequency of this e-beam source is 1 MV, 20 kA, 180 ns and 1<sup>50</sup> Hz, respectively. In contrast, the volume and weight of this source is limited to 2.5 m<sup>3</sup> and 2.2 ton. The energy density of a pulse forming network model in this source attains 23 kJ/m<sup>3</sup>. When working at single shots, this e-beam source gives an output voltage of 0.98 MV, current of 18 kA and power of approximate 20 GW. On the other hand, this e-beam source realizes an output voltage of 0.9 MV, current 18 kA and power 16 GW at a repetition frequency of 30 Hz. The source works very stable, with a jitter of 6 ns.
