RF measurements to determine tranverse impedance of a linear accelerator cell

Wednesday 6 June 2018 13:30 (1h 30m)

RF measurements, using previously published techniques, were made to determine the transverse impedance of a pillbox. The pillbox had near realistic physical dimensions of a cell being designed for a conceptual next generation multi-pulse linear accelerator. Details of the measurement techniques as well as comparison to analytical and simulated results will be presented.
