Propogating PV's with Free Web Tools to a Smart Home Device

Tuesday 4 June 2019 14:48 (6 minutes)

At the CLS we use a small part of an in-house development called ControlSystemWeb as an easy notification system for changes in PV's of interest, via texting or email. Using this notifier, plus IFTTT, Node-RED, and Google Home recipes, it is possible to have a home device announce these PV changes and further, to be able to turn this service on and off through voice commands.
