Looking for primordial black holes in the spectra of GRBs and FRBs

Tuesday 5 May 2020 14:15 (15 minutes)

The massive compact halo objects (MACHOs) such as primordial black holes or dense mini-halos can gravitational lens the signal of gamma ray bursts (GRB) and fast radio bursts (FRB). I will discuss that most GRB spectra are inappropriate for this kind of lensing searches due to their large sizes. However, FRB lensing, producing a characteristic interference pattern in the frequency spectrum, can probe the MACHOs in the mass range from 10^{-4} to 0.1 solar mass.

Summary

Authors: XUE, Wei (CERN); KOPP, Joachim (CERN); KATZ, Andrey (CERN); SIBIRYAKOV, Sergey (CERN & EPFL & INR RAS)

Presenter: XUE, Wei (CERN)

Session Classification: DM III

Track Classification: Dark Matter
