Long-lived particle search @ LHC

Monday 4 May 2020 17:30 (15 minutes)

Long-lived particle is well motivated for the new physics search both for collider phenomenology and dark sector. We make use of new variables related to position to search for long-lived, basing on current CMS detector and the Phase-2 Upgrade of the CMS endcap calorimeter which is a high granularity silicon-based calorimeter (HGCal). We study the long-lived particle signal induced by long-lived sterile neutrino and long-lived Higgs portal particle. The position related variables have been developed to suppress QCD and fake track backgrounds. The final results depends on trigger performance and are generally promising.

Summary

Authors: LIU, Zhen (Fermilab); WANG, Xiaoping; LIU, Jia (University of Chicago); WANG, LianTao (University of Chicago)

Presenter: WANG, Xiaoping

Session Classification: BSM II

Track Classification: BSM
