#### Quantum information/computing/technology: push quantum into the macroscopic world

### Quantum information paradox (gravity+quantum mechanics):

Does spacetime emerge from entanglement?

Do black holes have interiors?

Does the universe exist outside our horizon?

• What is the information-theoretic structure of quantum field theories?

• Can quantum computers simulate all physical phenomena?

• How does quantum information flow in time?

Fabio Maltoni — Quantum Observables in HEP- Milano 8 Nov 2024

### What can we learn on Fundamental Interactions from quantum information ideas/methods/techniques/results?

#### \*lo stimo più il trovar un vero, benché di cosa leggiera, che 'l disputar lungamente delle massime questioni 🥻 🏠 senza conseguir verità nissuna.

What can we learn on Fundamental Interactions from quantum information ideas/methods/techniques/results?

What can we learn on Fundamental Interactions from quantum information ideas/methods/techniques/results?

This is not a new question in HEP: B-flavour oscillations

Fabio Maltoni – Quantum Observables in HEP- Milano 8 Nov 2024

What can we learn on Fundamental Interactions from quantum information ideas/methods/techniques/results?

This is not a new question in HEP: neutrino-flavour oscillations

 $|\Psi(t)\rangle_{\alpha} = a_{\alpha e}(t) |100\rangle + a_{\alpha \mu}(t) |010\rangle + a_{\alpha \tau}(t) |001\rangle$ 

Neutrino oscillations as bi- and tri-partite systems [Blasone et al.] to more recent analyses of neutrino oscillations [Banerjee et al.]. See also [Kumar et al.]. Possibility of using quantum observables to access the mass hierarchy [Dixit et al.], distinguishing between Majorana vs Dirac [Richter et al.]. For a very interesting proposal to use Leggett-Garg violations at different energies was made [Formaggio et al.].

What can we learn on Fundamental Interactions from quantum information ideas/methods/techniques/results?

- •Recent and growing interest in the high- $Q^2$  collider **community** with ~100 papers in the last few years.
- Broadening of interests in more formal and pheno aspects.
- •First experimental results appeared starting Nov 2023!

Date of paper

Fabio Maltoni — Quantum Observables in HEP- Milano 8 Nov 2024

My personal motivations:

- •Community pride:  $\mathbb{QM} \subset \mathbb{QFT}$
- •Meaning: A plethora of fundamental results (theorems!) for QI : what do they mean for HEP?
- •Impact: And viceversa, what can be learnt on QI from particle physics?
- •Value: Opportunity to elaborate (and communicate) what is important/interesting in our field:

New Physics  $\equiv$  Uncharted SM physics + BSM

## Basics Composite systems

#### The properties are different for pure and mixed states

Fabio Maltoni – Quantum Observables in HEP- Milano 8 Nov 2024

#### Generic state (entangled)

$$\begin{split} |\psi\rangle &= \sum_{ij} p_{ij} |a_i\rangle \otimes |b_j\rangle \qquad p_{ij} \in \mathbb{C} , \sum_{ij} p_{ij} p_{ij}^* = 1 \\ |a_i\rangle, |b_j\rangle \text{ orthonormal bases} \end{split}$$

#### Non-separable (generic)

$$= \sum_{ijkl} p_{ij} p_{kl}^* |a_i\rangle \otimes |b_j\rangle \langle a_k| \otimes \langle b_l| = \sum_{ijkl} p_{ij} p_{kl}^* |a_i\rangle \langle a_k| \otimes |b_j\rangle \langle b_l|$$

$$\rho_A = \operatorname{Tr}_B \left[\rho\right] = \sum_{ijl} p_{ij} p_{kj}^* |a_i\rangle \langle a_k|$$

$$\rho_B = \operatorname{Tr}_A \left[\rho\right] = \sum_{ijl} p_{ij} p_{il}^* |b_j\rangle \langle b_l|$$

## Basics Entanglement

### Theorem: If $|\psi\rangle$ is a **pure state** of the AB system, then two bases exist such that (in A and B)

Consequences:

1. One can always think of a mixed state as the trace out a subsystem in a large system (purification). 2. Two subsystems that partition a pure state are entangled IFF their reduced states are mixed.

 $\sum \lambda_i = 1, \quad \lambda_i \ge 0$ 

of the subsystems are mixed-states! he same eigenvalues => they are equally impure

## Basics Entanglement

**Exercise 22:** Consider the system C composed by two qubits A and B, to be in a maximally entangled pure Bell state:

$$|\Psi^{-}\rangle_{C} = \frac{|0\rangle_{A}|1\rangle_{B} - |1\rangle_{A}|0\rangle_{B}}{\sqrt{2}}$$

Show that the two qubits are in maximally impure states.

**Solution:** We have:

$$\rho_C = |\Psi^-\rangle \langle \Psi^-| = \frac{1}{2} (|01\rangle - |10\rangle) (\langle 01| - \langle 10|)$$
$$= \frac{1}{2} (|01\rangle \langle 01| - |10\rangle \langle 01| - |01\rangle \langle 10| + |10\rangle \langle 10|) .$$

We can now trace out one of the two qubits, for instance B:

$$\begin{split} \rho_A &= \operatorname{Tr}_B[\rho_C] = \frac{1}{2} \operatorname{Tr}_B\left[|01\rangle\langle 01| - |10\rangle\langle 01| - |01\rangle\langle 10| + |10\rangle\langle 10|\right] \\ &= \frac{1}{2} \left(|0\rangle\langle 0|\langle 1|1\rangle - |1\rangle\langle 0|\langle 0|1\rangle - |0\rangle\langle 1|\langle 1|0\rangle + |1\rangle\langle 1|\langle 0|\right) \\ &= \frac{1}{2} \left(|0\rangle\langle 0| + |1\rangle\langle 1|\right) \\ &= \frac{\mathbb{I}}{2} \,, \end{split}$$

and the same is obtained if tracing over A

$$\rho_B = \operatorname{Tr}_A[\rho_C] = \frac{\mathbb{I}}{2}.$$

Since  $\text{Tr}_{A,B}[\rho_{A,B}^2] = 1/4$  the systems A and B are mixed, more precisely maximally mixed.

Fabio Maltoni — Quantum Observables in HEP- Milano 8 Nov 2024

## Basics Concurrency

Take an entangled **pure** state between the two subsystems A and B. As a result, the states in A and B must be mixed and

$$\operatorname{Tr}\left[\rho_{A}^{2}\right] \leq 1$$
 and  $\operatorname{Tr}\left[\rho_{B}^{2}\right]$ 

The concurrency  $C_{A|B}$  is defined as

$$0 \le C_{A|B}^2 = 2(1 - \text{Tr}[\rho_A^2]) = C_{B|A}^2 \le$$

For mixed states, things are in general more complicated.

### $\mathcal{H} = \mathcal{H}_A \otimes \mathcal{H}_B$

 $\leq 1$ 

$$C_{A|B}^2 = 2S_2(\rho_A)$$

Tsallis-2 linear entropy

## Basics **Peres-Horodecki criterium**

This is a necessary (and for two qubits sufficient) criterium for separability of a mixed state of two subsystems A and B. Consider a generic state:

$$\rho = \sum_{ijkl} p_{ij} p_{kl}^* |a_i\rangle \otimes |b_j\rangle \langle a_k| \otimes \langle b_l|$$

And the partial transpose on B

$$\rho^{T_B} = (I \otimes T)[\rho] = \sum_{ijkl} p_{ij} p_{kl}^* |a_i\rangle \langle a_k| \otimes (|b_j\rangle \langle b_l|$$

 $\mathcal{H} = \mathcal{H}_A \otimes \mathcal{H}_B$ 

# $|)^{T} = \sum p_{ij} p_{kl}^{*} |a_{i}\rangle \langle a_{k}| \otimes |b_{l}\rangle \langle b_{j}| = \sum p_{il} p_{kj}^{*} |a_{i}\rangle \langle a_{k}| \otimes |b_{j}\rangle \langle b_{l}|$

The criterion states that if  $\rho$  is separable then all the eigenvalues of  $\rho^{T_B}$  are non-negative. In other words, if  $\rho^{T_B}$  has a negative eigenvalue, then the system is guaranteed to be entangled.

## **Basics** Bell (Clauser, Horne, Shimony, and Holt) inequalities

$$A = \pm 1$$
$$A' = \pm 1$$

Assuming: 1] Measurements reveal element of reality, physical properties present beforehand. 2] Alice and Bob are separated by a space-like distance

Then:

E(AB) + E(AB') + E(

Fabio Maltoni — Quantum Observables in HEP- Milano 8 Nov 2024

 $B = \pm 1$ 

 $B' = \pm 1$ 

$$E(A'B) - E(A'B') \le 2$$

## Basics **Bell (Clauser, Horne, Shimony, and Holt) inequalities**

Proof:

E(AB) + E(AB') + E(A'B) - E(A'B')= E(AB + A'B + A'B - A'B')= E(A(B + B') + A'(B - B'))

Now  $B + B' = 0 \Rightarrow B - B' = \pm 2$  and viceversa. So

 $AB + A'B + A'B - A'B' = \pm 2$ 

So for the expectation value

Fabio Maltoni — Quantum Observables in HEP- Milano 8 Nov 2024

a,a',b,b'

Comments:

- i) Bell inequalities have nothing to do with quantum mechanics.
- ii) In the last 40 years experiments have proven them over larger and larger distances.
- iii)Discussions on possible loopholes have heated and continue to keep the community of experts busy.

 $E(AB) + E(AB') + E(A'B) - E(A'B') = \sum p(a, a', b, b')(ab + ab' + a'b - a'b') \le 2$ 

## **Basics** Bell (CHSH) inequalities : QM

$$|\Psi
angle = rac{1}{\sqrt{2}}(|\uparrow
angle \otimes |\downarrow
angle - |\downarrow
angle \otimes |\uparrow
angle)$$

 $A(a) = \hat{S}_x \otimes I$  $E(AB) = \langle A(a)B(b) \rangle = \frac{1}{\sqrt{2}}$ 

$$A(a') = \hat{S}_z \otimes I \qquad \qquad E(AB') = \langle A(a)B(b') \rangle = \frac{1}{\sqrt{2}}$$

$$B(b) = -\frac{1}{\sqrt{2}}I \otimes (\hat{S}_z + \hat{S}_x) \qquad \qquad E(A'B) = \langle A(a')B(b) \rangle$$

$$B(b') = \frac{1}{\sqrt{2}} I \otimes (\hat{S}_z - \hat{S}_x) \qquad \qquad E(A'B') = \langle A(a')B(b') \rangle$$

 $E(AB) + E(AB') + E(A'B) - E(A'B') = 2\sqrt{2}$

# Kinematics

Fabio Maltoni — Quantum Observables in HEP- Milano 8 Nov 2024

$$\hat{\theta}_{ai} \cos \theta_{bj} \qquad \qquad \hat{t} : \quad \hat{k} = \text{top direction}, \quad \hat{r} = \frac{\hat{p} - \hat{k} \cos \theta}{\sin \theta}, \quad \hat{n} = \frac{\hat{p} \times x}{\sin \theta}, \quad \hat{r} = \frac{\hat{r} \times x}{\sin \theta}, \quad \hat{r} =$$

## Quantum tops

$$\hat{k} = \text{top direction}, \quad \hat{r} = \frac{\hat{p} - \hat{k} \cos \theta}{\sin \theta}, \quad \hat{n} =$$

We can write four sufficient conditions for entanglement:

$$-C_{kk} - C_{rr} - C_{nn} \equiv -3D^{(1)} > 1$$
  
$$-C_{kk} + C_{rr} + C_{nn} \equiv -3D^{(k)} > 1$$
  
$$+C_{kk} + C_{rr} - C_{nn} \equiv -3D^{(n)} > 1$$
  
$$+C_{kk} - C_{rr} + C_{nn} \equiv -3D^{(r)} > 1$$

 $D < -1/3 \implies \text{Entanglement}$ 

Fabio Maltoni – Quantum Observables in HEP- Milano 8 Nov 2024

$$\mathcal{C}^{(\text{singlet})} = \begin{pmatrix} -\eta & 0 & 0 \\ 0 & -\eta & 0 \\ 0 & 0 & -\eta \end{pmatrix}, \ 0 < \eta \le 1$$

$$\mathcal{C}^{(\text{triplet})} = \begin{pmatrix} \eta \ 0 & 0 \\ 0 \ \eta & 0 \\ 0 \ 0 & -\eta \end{pmatrix}, \qquad 0 < \eta \le 1$$

Where D=- $\eta$  and in the limiting case of  $\eta = 1$  we have the four Bell states:

$$\begin{split} |\Phi^{\pm}\rangle &= \frac{1}{\sqrt{2}} \big( |\uparrow\uparrow\rangle \pm |\downarrow\downarrow\rangle \big), \\ |\Psi^{\pm}\rangle &= \frac{1}{\sqrt{2}} \big( |\uparrow\downarrow\rangle \pm |\downarrow\uparrow\rangle \big). \end{split}$$

$$\int_{aa'bb'} \hat{k}$$

$$\int_{aa'bb'} \left| \sum_{ij} C_{ij} \left( a_i b_j - a_i b'_j + a'_i b_j + a'_i b'_j \right) \right| = 2\sqrt{\lambda + \lambda}$$
where  $\lambda$  and  $\lambda'$  are the two largest eigenvalues of  $C^T C$ .  
 $\sqrt{2} | -C_{rr} + C_{nn} | \le 2 \implies$  Bell condition (with axis choice)

## Proof

#### 6.4 Bell violations in mixed states

To complete our discussion relating the formal results we reached in the previous Sections to phenomenology, we briefly illustrate how to detect Bell violations in mixed states. We focus on the case of two qubits, which is the simplest algebraically, and also very relevant for HEP applications. Consider again the two-qubit density matrix:

$$\rho = \frac{1}{4} \mathbb{I}_2 \otimes \mathbb{I}_2 + \frac{1}{4} \sum_{i,j=1}^3 C_{ij} \left( \sigma_i \otimes \sigma_j \right), \tag{6.33}$$

corresponding to a pair of spin 1/2 particles with unpolarized spins,  $\langle S \rangle = B = 0$ , but nonzero spin correlations. The four observables entering the Bell operator (4.9) correspond to four directions upon which spin can be measured:

$$Q \equiv \hat{a}, \ R \equiv \hat{a}', \ S \equiv \hat{b}, \ T \equiv \hat{b}'.$$
(6.34)

To be consistent with the discussion in Section 4, we normalize the outcome of such spin measurements so they take values between -1 and 1. With this notation, the CHSH inequality reads:

$$\langle \mathcal{B} \rangle = \langle \hat{a}\hat{b} + \hat{a}'\hat{b} + \hat{a}\hat{b}' - \hat{a}'\hat{b}' \rangle \le 2.$$
(6.35)

The expectation value of  $\mathcal{B}$  on the state (6.33) is simply:

$$\langle \mathcal{B} \rangle = \operatorname{Tr}[\rho \,\mathcal{B}] = \sum_{ij} C_{ij} \,(\hat{a}_i \hat{b}_j + \hat{a}'_i \hat{b}_j + \hat{a}_i \hat{b}'_j - \hat{a}'_i \hat{b}'_j).$$
(6.36)

We now look for the **optimal directions**, that is, the choice of  $\hat{a}, \hat{a}', \hat{b}, \hat{b}'$  such that  $\langle \mathcal{B} \rangle$  is maximized. It is useful to introduce the auxiliary unit vectors:

$$\hat{d} = \frac{\hat{b} - \hat{b}'}{2\cos\varphi}, \quad \hat{d}' = \frac{\hat{b} + \hat{b}'}{2\sin\varphi}, \tag{6.37}$$

where  $\cos^2 \varphi = \frac{1}{2}(1 - \hat{b} \cdot \hat{b}')$ , so that we can rewrite:

$$\langle \mathcal{B} \rangle = 2(\hat{a} \cdot C \cdot \hat{d} \cos \varphi + \hat{a}' \cdot C \cdot \hat{d}' \sin \varphi).$$
(6.38)

We now maximize this expression with respect to all the variables. First for  $\varphi$ :

$$\max_{\varphi} \langle \mathcal{B} \rangle = 2\sqrt{(\hat{a} \cdot C \cdot \hat{d})^2 + (\hat{a}' \cdot C \cdot \hat{d}')^2}.$$
(6.39)

To maximize with respect to  $\hat{a}$  and  $\hat{a}'$ , notice  $\hat{a} \cdot C \cdot \hat{d} = |C \cdot \hat{d}| \cos \theta$ , where  $\theta$  is the angle between  $\hat{a}$  and  $C \cdot \hat{d}$ . To maximize (6.39), one then simply takes  $\hat{a}$  aligned with  $C \cdot \hat{d}$ , and similarly  $\hat{a}'$  aligned with  $C \cdot \hat{d}'$ :

$$\max_{\varphi,\hat{a},\hat{a}'} \langle \mathcal{B} \rangle = 2\sqrt{|C \cdot \hat{d}|^2 + |C \cdot \hat{d}'|^2}.$$
(6.40)

To finally maximize over  $\hat{b}$  and  $\hat{b}'$  (or, in the new variables, over  $\hat{d}$  and  $\hat{d}'$ ), consider the identity:

$$|C \cdot \hat{d}|^2 = \hat{d}^{\mathsf{T}} C^{\mathsf{T}} C \hat{d}. \tag{6.41}$$

Since  $C^{\mathsf{T}}C$  is symmetric, it can be diagonalized preserving dot products:

$$C^{\mathsf{T}}C = \begin{pmatrix} \lambda_1 & 0 & 0\\ 0 & \lambda_2 & 0\\ 0 & 0 & \lambda_3 \end{pmatrix}, \quad \lambda_1 > \lambda_2 > \lambda_3 \ge 0.$$
 (6.42)

The maximum of (6.40), then, is obviously when  $\hat{d}$  and  $\hat{d'}$  are aligned with the two directions corresponding to the largest eigenvalues  $\lambda_1$  and  $\lambda_2$ :

$$\max_{\rho,\hat{a},\hat{a}',\hat{b},\hat{b}'} \langle \mathcal{B} \rangle = 2\sqrt{\lambda_1 + \lambda_2}.$$
(6.43)

This simple criterion relates a Bell violation to the **eigenvalues of**  $C^{\mathsf{T}}C$ . In particular, the Bell inequality is simply:

$$\lambda_1 + \lambda_2 < 1. \tag{6.44}$$

Tracing back our argument, we have also obtained that the optimal directions are:

$$\hat{a} = \hat{d},\tag{6.45}$$

$$\hat{a}' = \hat{d}',\tag{6.46}$$

$$\hat{b} = \hat{d}\cos\varphi + \hat{d}'\sin\varphi \tag{6.47}$$

$$\hat{b}' = -\hat{d}\cos\varphi + \hat{d}'\sin\varphi, \qquad (6.48)$$

where  $\tan \varphi = \sqrt{\mu_1/\mu_2}$ , and  $\hat{d}$  and  $\hat{d}'$  are the eigenvectors of  $C^{\mathsf{T}}C$  corresponding to  $\lambda_1$ and  $\lambda_2$ .

# Summary

$$\hat{k} = \text{top direction}, \quad \hat{r} = \frac{\hat{p} - \hat{k} \, \cos \theta}{\sin \theta}, \quad \hat{n} = \frac{\hat{p} \times \hat{k}}{\sin \theta}$$

We can write four sufficient conditions for entanglement:

$$-C_{kk} - C_{rr} - C_{nn} \equiv -3D^{(1)} > 1$$
  
$$-C_{kk} + C_{rr} + C_{nn} \equiv -3D^{(k)} > 1$$
  
$$+C_{kk} + C_{rr} - C_{nn} \equiv -3D^{(n)} > 1$$
  
$$+C_{kk} - C_{rr} + C_{nn} \equiv -3D^{(r)} > 1$$

D < -1/3 $\Rightarrow$  Entanglement

 $\sqrt{2}\left|-C_{rr}+C_{nn}\right|\leq 2$ 

 $\Rightarrow$  Bell violation (with axis choice)

The specific case where  $C_{xx} = C_{yy} = C_{zz} = -\eta$  with  $0 < \eta$  $\eta < 1$  corresponds to the singlet Werner state, while  $C_{xx} =$  $C_{yy} = -C_{zz} = \eta$  and cyclic permutations correspond to a triplet of Werner states (with fidelity  $F = \frac{3\eta + 1}{4}$ ). It is known that for Werner states,  $\eta > 1/3$  implies entanglement, while the CHSH inequality is violated when  $\eta > \sqrt{2}/2$ .<sup>1</sup>

## Is there a Quantum Advantage in the search for New Physics?

Two model-independent approaches:

1] BSM resides beyond the scales directly explored by the experiment  $\Rightarrow$  Effective Field Theory

2] BSM resonances can be directly produced  $\Rightarrow$  Simplified models

# Quantum Advantage for SMEFT

![](_page_41_Figure_1.jpeg)

- New interactions modify both conventional and quantum observables
- Dimension-6 operators can modify the degree of entanglement between top quarks
- •SMEFT introduce new structures, thus probing new linear combinations between coefficients
- •QI observables can break degeneracies between operators when combined with standard observables

# **Toponium modelling**

We can approximate the impact in the Monte Carlo by introducing a toy model with a resonance

- vector resonance for lepton collisions
- psedoscalar resonance for proton collisions

 $m_{\psi} = m_{\eta} \simeq 2m_{\rm t} - 2\,{
m GeV}, \quad {
m and} \quad \Gamma_{\psi} = \Gamma_{\eta} \simeq 2\,\Gamma_{\rm t}$ 

Peak of resonance fitted to match the results obtained by the resummed computation

Significant impact on entanglement markers, hence improvement of measurement agreement with theory Pseudoscalar resonance leads to different spin correlations compared to QCD

# **New directions...**

Several proposal exist for measurement at HL-LHC:

- Measurement of entanglement between two quark b from Z decay
  - Exploit the propagation of polarization to baryon final state
  - Reconstruct the b spin from the charged lepton in the  $\Lambda_b$  decay chain

![](_page_51_Figure_5.jpeg)

- Measurement of the post-decay entanglement
  - Study the evolution of entanglement after the decay of one of the particles
  - Proposed in top pair production, between the top and the W
  - In lepton colliders with polarised beams could also be possible to observe an increase in the entanglement compared to top-pair
- Multibody entanglement:
  - Across multiple qubit in the final state
  - Between particles and the momentum of the system
- entanglement

# Conclusions

- Quantum information and computing is hyped up. It promises a quantum advantage that, while not yet proven, could bring to transformative applications.
- The current status builds upon a number of theoretical and experimental advances in the last 30 years that have changed the way we think about quantum mechanics.
- Our current description of fundamental interactions, based on QFT, has QM at its core. Theoretically, it is embedded in our formalism so deeply that (sometimes) we do not even notice. Experimentally, however, most of our measurements are not correlations, but just counting experiments.
- A novel interest in looking at fundamental interactions at TeV scale with QI glasses has started since two/three years ago and has quickly lead to a variety of studies and interesting results, ...
