## The neutrinoless $\beta\beta$ process at the LHC

Tuesday 25 May 2021 16:45 (15 minutes)

The Majorana nature of neutrinos and whether lepton number symmetry is conserved are among the most pressing mysteries in physics today. This follows from their widespread implications for cosmology, nuclear physics, and particle physics. Along these lines, searches for the neutrinoless  $\beta\beta$  ( $0\nu\beta\beta$ ) decay mode of heavy nuclei are highly sensitive probes of these questions, albeit with important limitations. In this talk we present a new look into the high-energy realization of the  $0\nu\beta\beta$  process at the Large Hadron Collider (LHC). As a case study, we focus on the same-sign WW scattering process  $W^{\pm}W^{\pm} \rightarrow \mu^{\pm}\mu^{\pm}$ , which violates lepton number and is outside the reach of nuclear decay experiments. Whether mediated by heavy Majorana neutrinos or more generally by the Weinberg operator, we find that the LHC offers incredible complementarity to lower energy experiments and further extends the sensitivity to the nature of neutrinos.
