

1. Motivation

Accelerator of China Spallation Neutron Source (CSNS)

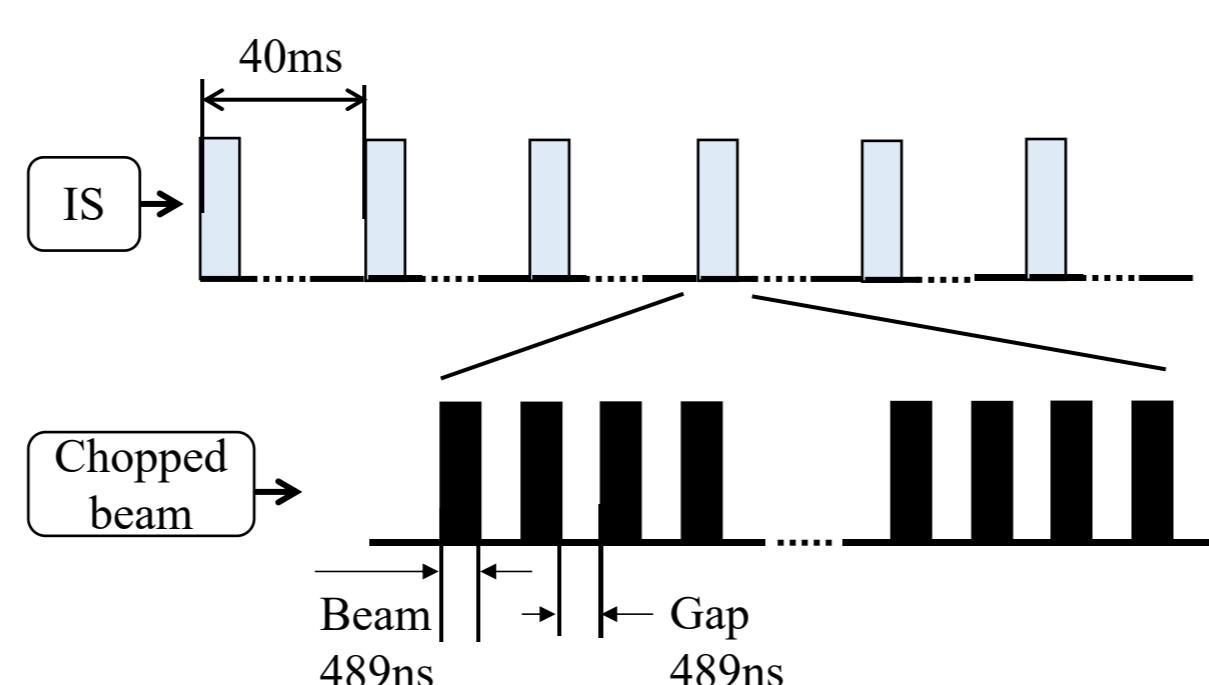

Beam power upgrade of CSNS project II

	CSNS-I	CSNS-II
Beam power (kW)	100	500
Repetition rate (Hz)	25	25
Average beam current (uA)	62.5	312
Beam energy (GeV)	1.6	1.6

Role of the beam chopper in CSNS LEBT

- Fast electric chopper
- The chopped beam pulses synchronize with the period of Rapid Cycling synchrotron (RCS)

Problems induced by the electric chopper for CSNS-II

- Destroy the space charge compensation (SCC) at RFQ entrance.
- Cause the rapid growth of H⁻ beam emittance
- Lower down the beam transmission rate in RFQ and downstream accelerator
- Limit the beam power upgrade of CSNS-II

2. Experimental Methods

Experimental setup

The LEBT and RFQ layout of CSNS

The MEBT layout of CSNS

The emittance is measured by double-slits emittance monitor (EM)

Data processing method

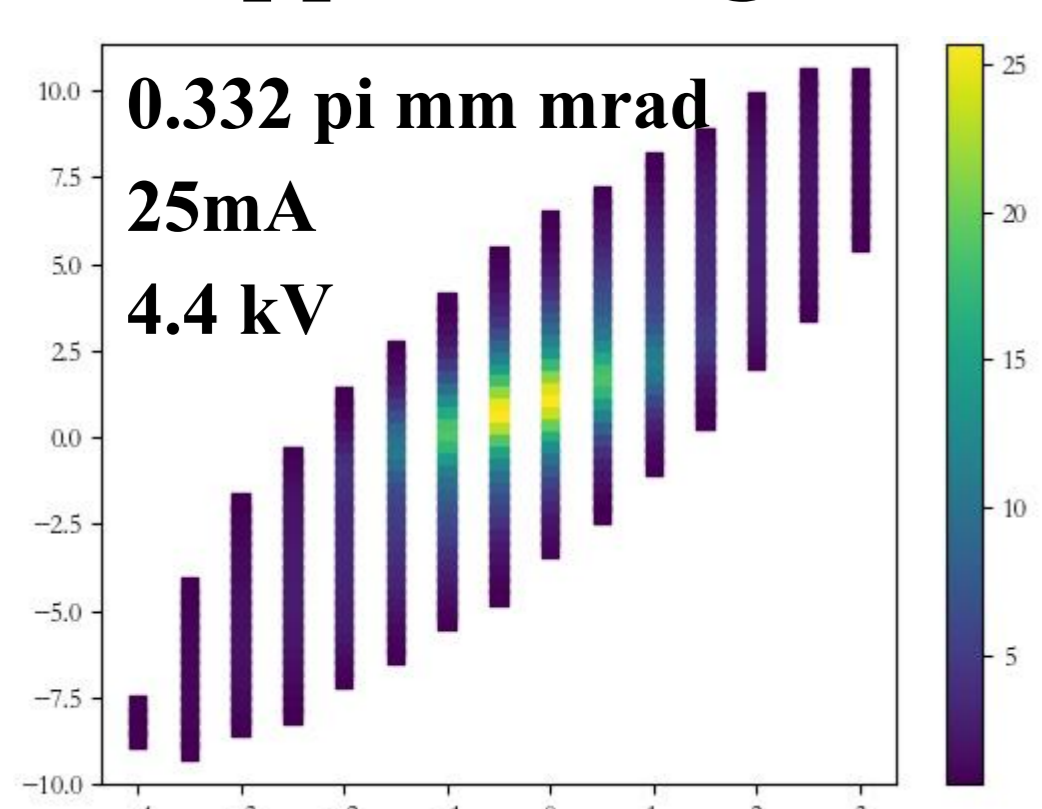

- Background signal removal
- Noise signal removal: Threshold method
- Normalized RMS emittance calculation

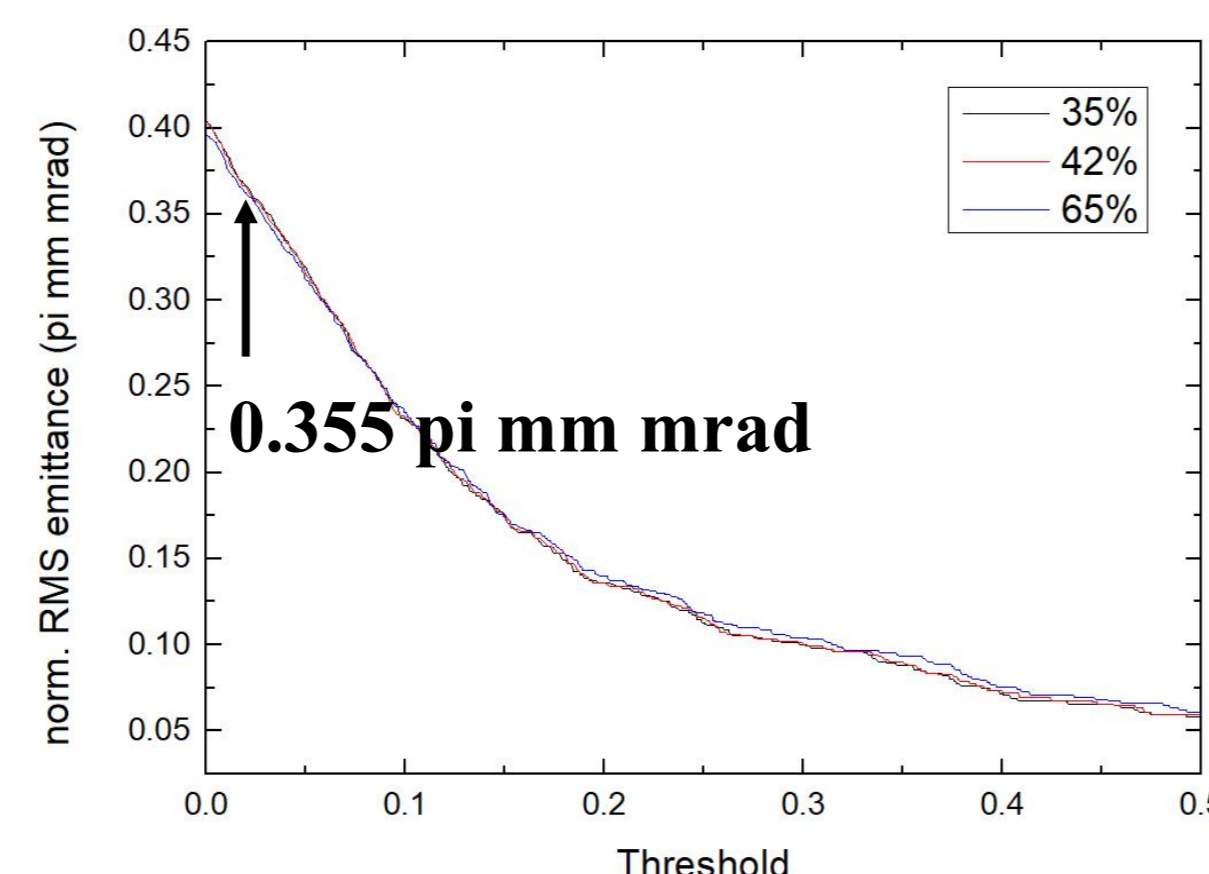

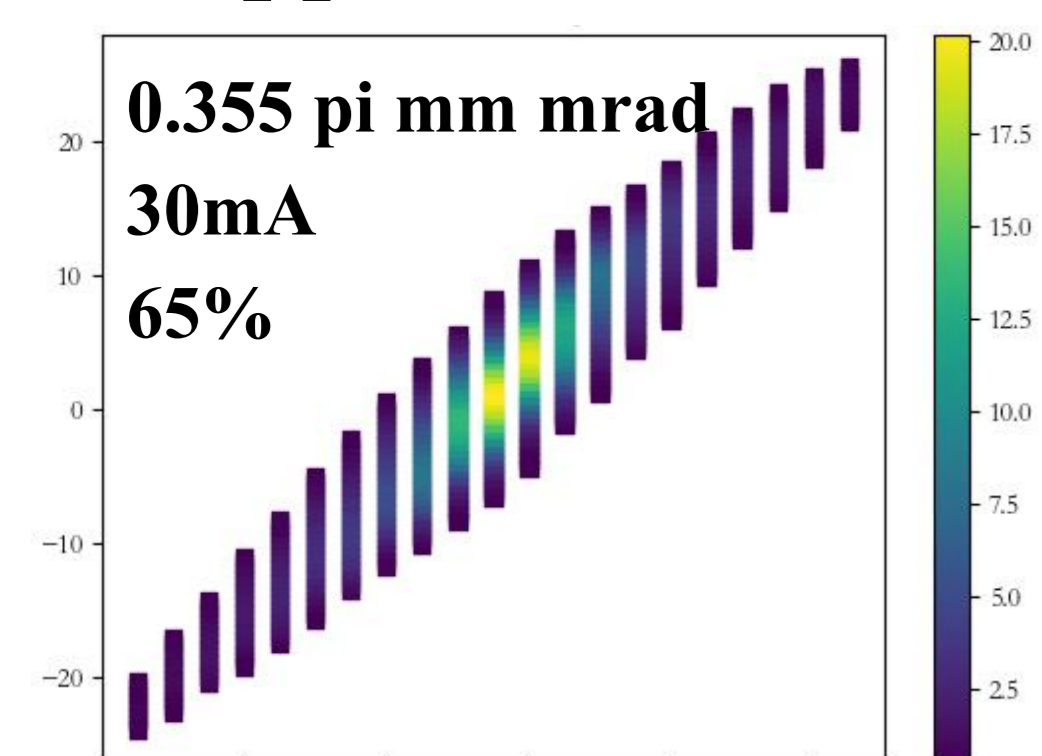

3. Results

Fixed beam parameters

Chopper Voltage

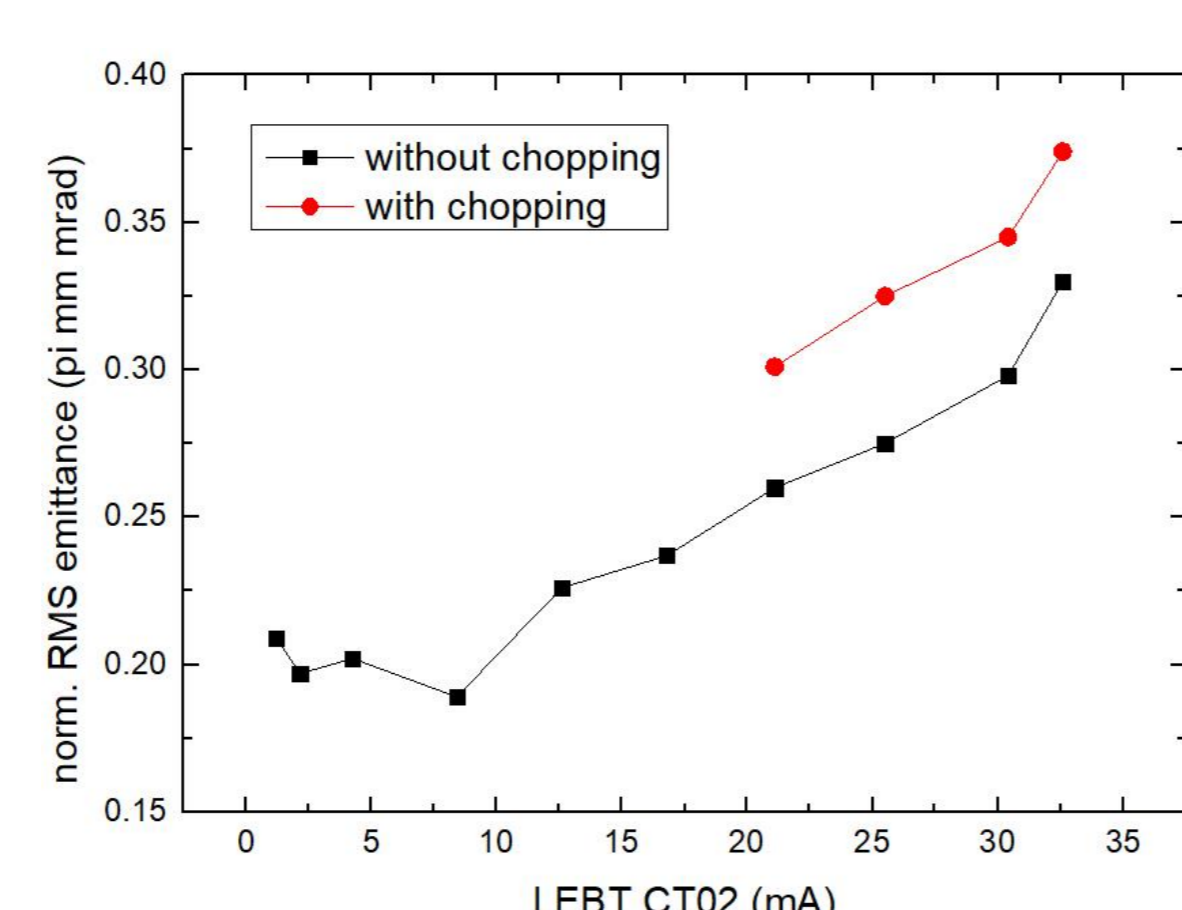

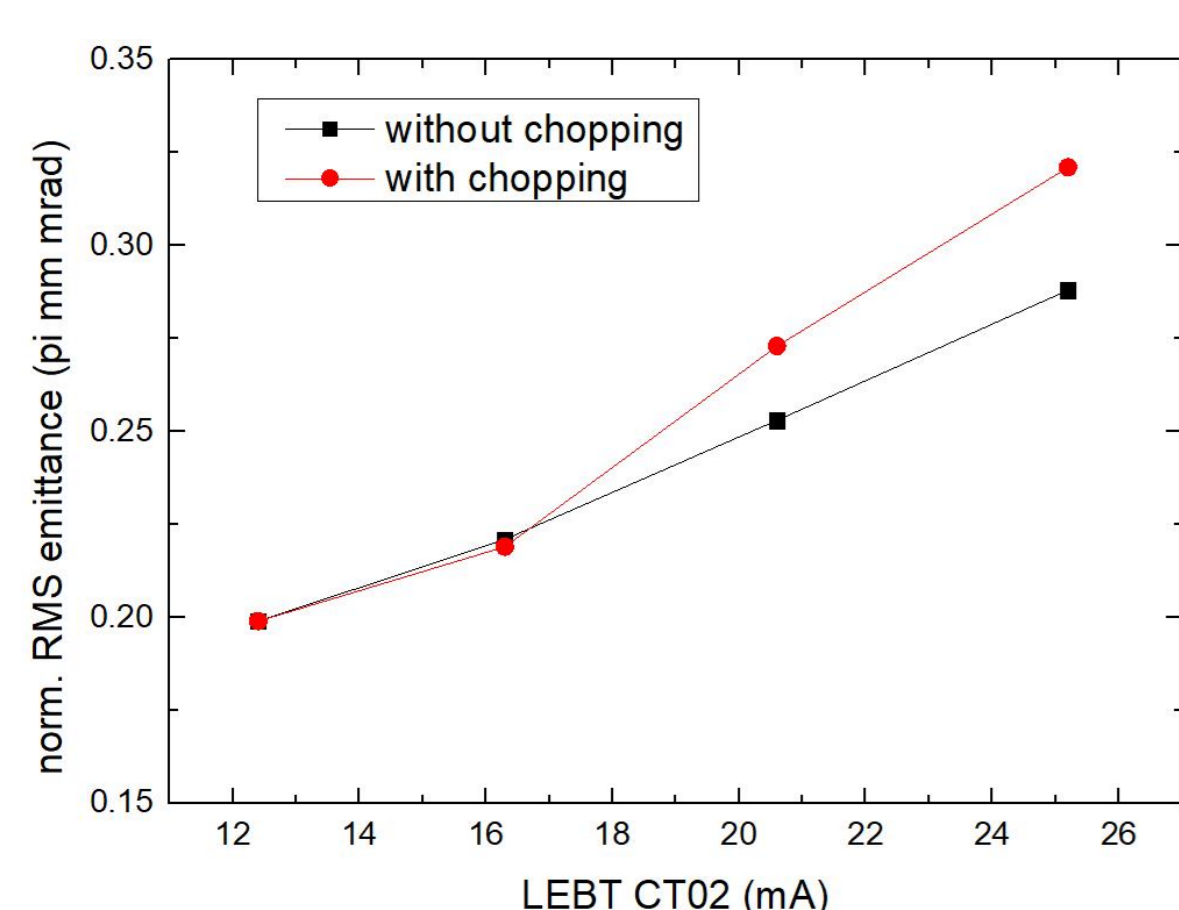

Chopped beam rate

Fixed chopper parameters

w/o chopping with different beam current

4. Discussion

Influence of beam focusing state on emittance calculation

Threshold method: looking for inflection point

The effect of chopper voltage to the emittance growth is not obvious while chopper voltage is above 3.9 kV

Emittance growth caused by SCC effect destruction is not significant below 16mA

Emittance growth at 50 mA

- Without chopping, extrapolation of linear fitting: 0.401 pi mm mrad at 50 mA
- With chopping, extrapolation of linear fitting: 0.469 pi mm mrad at 50 mA

5. Future Directions

- Simulation of emittance growth induced by beam chopping
- Redesign of the chopper
 - Shorten the length of SCC destruction
