Bounds on IDM from the electroweak vacuum metastability

Wednesday 14 October 2015 17:50 (15 minutes)

We add a Z_2 -odd complex scalar doublet to the Standard Model at TeV scale. The lightest neutral particle of the doublet is a viable dark matter candidate. We have shown various phase diagrams and point out the regions of absolute stability, meta-stability and instability for the electroweak vacuum and review the bounds on the model.
