

## Search for dark matter decay and annihilation using observation by Tibet AS<sub>γ</sub> and LHAASO

*Tuesday 15 October 2024 15:45 (15 minutes)*

Recently, Tibet AS<sub>γ</sub> and LHAASO have observed very high energy diffuse gamma rays in the Galactic plane between 10 TeV and 1 PeV energies. In our work, we utilize these observations to search for dark matter decay or annihilation signals to Standard Model particles. In addition to the primary gamma-ray originating from various Standard Model particles, we also include secondary gamma-rays generated in these processes. We also consider the effects of dark matter substructures and tidal disruption. We place constraints on dark matter annihilation cross-section and decay lifetime for a wide range of dark matter masses. Future observation of these high-energy gamma rays can further help us either discover particle dark matter or better constrain its properties.

### Track type

Dark Matter

**Authors:** Mr DUBEY, Abhishek (Indian institute of science, Bangalore); KUMAR SAHA, Akash; MAITY, Tarak Nath (Indian Institute of Science); LAHA, Ranjan (Indian Institute of Science, Bangalore)

**Presenter:** Mr DUBEY, Abhishek (Indian institute of science, Bangalore)

**Session Classification:** Parallel - Dark Matter
