

## Dark-Matter Mass from Angular Dependence

*Wednesday 16 October 2024 18:15 (15 minutes)*

We propose a novel method to determine the mass scale of ambient dark matter that can be generally applied to the (at least effectively) two-dimensional direct detection experiments allowing for directional observables. Due to the motions of the solar system and the Earth relative to the galactic center and the Sun, the dark-matter flux carries a directional preference. We first formulate that dark-matter event rates have a non-trivial dependence on the angle between the associated detection plane and the overall dark-matter flow and that the curvature of this angular spectrum encrypts the mass information. For proof of principle, we take the recently-proposed Graphene-Josephson-Junction-based superlight dark-matter detector (named as GLIMPSE) as a concrete example and demonstrate these theoretical expectations through numerical analyses.

### Track type

Dark Matter

**Author:** Prof. PARK, Jong-Chul (Chungnam National University (KR))

**Co-author:** KIM, Doojin (University of South Dakota)

**Presenter:** Prof. PARK, Jong-Chul (Chungnam National University (KR))

**Session Classification:** Parallel - Dark Matter
