## Electron Trap as a meV Axion and Dark Photon Dark Matter Detector

*Tuesday 14 May 2024 15:00 (15 minutes)*

Detecting axion and dark photon dark matter in the milli-eV mass range has been considered being a significant challenge due to its frequency being too high for high-Q cavity resonators and too low for single-photon detectors to register. I will present a method that overcomes this difficulty (based on recent work arXiv:2208.06519) by using trapped electrons as high-Q resonators to detect axion and dark photon dark matter, and set a new limit on dark photon dark matter at 148 GHz ( $\sim 0.6\text{meV}$ ) that is around 75 times better than previous constraints by a 7 days proof-of-principle measurement. I will also propose some updates to this work that improve the result a lot by optimizing some of the experimental parameters and techniques.

### Mini Symposia (Invited Talks Only)

**Authors:** XIAO, Yawen; GRAHAM, Peter; GABRIELSE, Gerald (Harvard University); RAMANI, Harikrishnan; HARNIK, Roni (Fermilab); FAN, Xing; Mr WONG, Samuel (Stanford University); MYERS, Thomas; SUKRA, Benedict

**Presenter:** XIAO, Yawen

**Session Classification:** Dark Matter

**Track Classification:** Dark Matter
